Welcome to The **Atari** **Book** 40th Anniversary Special

Welcome to this 40th anniversary celebration of everything Atari. Ever since Nolan Bushnell first co-founded Atari Inc with Ted Dabney in 1972, the name has become synonymous with games. Atari Inc attracted some of the best talent in the industry, many of who were raising the bar when it came to creating new genres and new hardware, with their goal being to create the best games possible. Atari dominated the arcades, then performed the same miracle in homes with the release of the Atari VCS, or Atari 2600 as it's now more commonly known. Pong was Atari's first major success, but it wouldn't be the last and many other hits followed, including Asteroids, Tempest and Paperboy. Even when Atari Inc was closed down, it wasn't the end of the brand, as the company rose from the ashes in the form of Atari Corporation, under the watchful eye of ex-Commodore head Jack Tramiel. Atari Corporation itself would eventually become a relic of the past, but the Atari brand, and more importantly, its iconic games, live on. So join us as we highlight some of Atari's best machines, the most important developers and the greatest games to ever appear on an Atari system.

WHY THE ATARI 2600 WAS GREAT...

EVEN TODAY THE ATARI 2600 IS A THING OF BEAUTY. BUILT TO LAST AND FEATURING THAT FAMOUS WOODEN VENEER, FEW THINGS IN LIFE COULD GIVE US AS MUCH PLEASURE AS A DAY SPENT IN FRONT OF THE TV PLAYING SPACE INVADERS OR COMBAT. IT MAY HAVE ALL ENDED IN TEARS FOR ATARI, BUT THE 2600 REMAINS ONE OF THE DEFINING ASPECTS OF ITS LEGACY.

ATARI 2600

AFTER ITS RELEASE OF ITS PORT OF SPACE INVADERS, THE ATARI 2600 WAS TO BECOME AN OVERNIGHT SENSATION, FORGING MILLIONS OF MINDS TO THE WONDROUS BEAUTY OF VIDEOGAMES. IT'S EASY TO LOOK BACK AT THE SUCCESS OF ATARI'S HOME CONSOLE NOW, BUT THINGS WEREN'T LOOKING SO STRAIGHTFORWARD WHEN THE MACHINE WAS FIRST PROPOSED...

It's one of the most iconic consoles Atari ever made, and helped turn the company into a multi-million dollar behemoth, but the birth of the Atari 2600 wasn't as straightforward as many have been led to believe. In fact it was during the summer of 1975 that Atari's research lab, Cyan, would hit on its most important contribution to the now fondly remembered console thanks to Steve Meyer and Ray Milner. The question they had been asking themselves on the trip back from a meeting at Atari was "Could we leverage microprocessors to create a game console that can support multiple interchangeable games?". As it turns out, management had also been pondering the very same idea as Meyer and Milner, but wanted to take it a step further. "Nolan, and Joe (Keenan, Atari President), and I sat around as a team and decided we needed a cartridge based game system," said Allan Alcorn, about Atari's classic console. With Alcorn giving the go ahead to Milner and Mayer to being the research, upon returning to the Cyan facilities the duo began researching what microprocessors were available on the fledgling market to start basing their proof of concept around.

Time for a trip

Milner and Meyer decided to take a trip up to the electronics convention Wescon after receiving a letter from a new, unheard of company who wanted them to come take a look at their new microprocessor. They were soon to discover that the company was a young upstart in microprocessors, in an industry that was itself very young, and was poised to rock the foundation. That upstart happened to be MOS Technology, which was led by Chuck Peddle. After getting their 6502 with documentation, the two headed in to see Peddle and his people demonstrating the microprocessors. They met and talked for about an hour and a half, finally negotiating with Peddle to come over to Cyan the very next day to discuss plans for using MOS's 6502 and support chip in their proposed game system. Peddle and his team then headed over to Cyan, where they met and discussed the proposal over the next two days. In the end, Cyan decided to sign on with MOS Technology's chip, but not the 6502. Because it was being targeted as a mass produced game system, cost was something of an issue for Cyan and the proposed 6507 was more in line to meet that goal. With the

6507 and the support chip, they'd just need to design a custom chip for graphics and sound support, which would be a lot easier.

By December of '75, Milner and Mayer were able to get a working, although rather buggy prototype going, to play a home version of Atari/Kee's hit arcade game *Tank*. Using the 6502 development setup along with the beginnings of a custom graphics chip, the two had even appropriated the joysticks from a *Tank* coin-op for the primordial systems controls, which gave the project a far more authentic feel.

At that point a young engineer by the name of Joe Decuir was hired by Alcorn to help debug the project and bring it back from Cyan to Atari for it's next stage, working as a bridge of sorts. Joe Decuir had been a graduate of the local UC Berkeley and working in medical instrumentation design but looking for a way out. "We were using expensive new equipment

ORIGINS

The name of "Atari" originates from the one of the world's oldest board games, *Go*, which Nolan Bushnell was known to enjoy playing and denotes the following: "a group of stones is in Atari if it has only one liberty left." As for the Atari symbol, it was designed by George Opperman in the early 1970s. By all accounts, *Pong* was very popular and the large letter 'A' represented two opposing videogame players with the centre of the *Pong* court in the middle. Got that? As for classic 2600 games that we still love playing, you really can't go wrong with: *Combat*, *Demon Attack*, *Adventure*, *River Raid*, *Solans*, *Pitfall*, *Yars Revenge*, *Kaboom*, *Frogger*, *Haunted House* and *H.E.R.O.* Also, the Intellivision was not the only system to feature voice synthesis as the 2600 also had *Quadron*, *Open Sesame* and *Berzerk* – the latter being an enhanced but hacked version. Bless...

» This is *Go*. It's loved the world over thanks to its challenging and deep gameplay and is held in particularly high regard in Japan.

The machines

» The Atari 2600 was a massive success for Atari and set the standard for everyone else to follow. It shifted over 30 million units in its lifetime.

» There were some superb games available for the Atari 2600. *Yar's Revenge* from Howard Scott Warshaw is a particular favourite of ours.

**COCCODRILLI, CANNIBALI, MACIGNI ROTOLANTI.
E' JUNGLE HUNT.
L'ULTIMA SFIDA DEI VIDEOGIOCHI ATARI.**

La tua bella e prigioniera dei cannibali.
Devi salvarla. Ma nulla è più esotico della
giungla. Sfringi i denti a voi. Sola resistenza
puoi continuare a giocare e raggiungere il
punteggio più alto. Questo è il bello di Atari:
che la sfida diventa sempre più difficile.

ATARI

ATARI. NIENTE DIVERTE DI PIU'.

» One of the classic retro 2D action/adventure games: Activision's *Pitfall!*. Quite why brick walls exist in secret underground chambers in a forbidden jungle is anyone's guess...

to try heroically to save people in really bad shape. Most of them (91%) died either way. It was kind of demoralizing." A friend of Decuir's, Ed DeWath, had known Milner and recommended Decuir for Cyan. Decuir actually wasn't sure about going in to games, but luckily for all of us he was convinced by his father and another friend. "My father said 'Pick the job that teaches you more', and Cyan/Atari had the potential to teach chip design," Decuir said about that pivotal moment, which helped shape the future of Atari's console. "My friend Greg said 'you can do good for the world with games. Most people are sick by their own hand: smoking, bad eating, etc. and are also lonesome and bored. Go ahead and entertain them.'"

The Decuir/Miner factor

Decuir listened to the advice of his good friend and immediately set about debugging the demo system, and one of the first things he had to do was have an account created on the DEC PDP-11 timesharing system the group was using for cross-assembling the demo game code. Needing a password, he chose the name of his favorite bike (which he still owns and rides to this day), Stella. The name would stick and eventually become the code name for the 2600's custom graphics chip, but in the mean time Decuir's goal was getting the *Tank* game further along in time for a February 1976 demonstration to Bushnell, Keenan, and Alcorn, who were all eager to see Decuir's progress. The prototype's architecture at that time was extremely influenced by the coin-op arcade game design Cyan had also done for Atari. That would certainly make sense, given the goal of the 2600 was to play all the early and mid 1970's coin-op games Atari had produced.

Now that the project was approved to move on and come down from Cyan to Atari, Atari was going to have to bring someone on board in order to design the full custom graphics chip. They knew none of the engineers that were currently in coin-op would be up to the task of that advanced custom chip layout design called VLSI (Very-Large-Scale Integration) so they decided to look for a suitable expert to help them achieve their dream.

"I'd never designed a chip like that before, so I didn't want to do that and that's when I brought Jay Miner to do it since he'd already

» *Grand Prix* was a belter of a driving game and still plays well today, even when compared to visual eyeball candy driving sims on the 360!

The original console of the Atari 2600 released in 1977. With wooden panelling from a Swedish log cabin and immune to damage, it was alleged that the basic design was influenced from German weapon technology from 1945...

In the early 1980s, the very sight of the 2600 was to be every schoolboy's wet dream and Santa soon had his elves making millions of them.

had experience in designing those chips," said PONG-On-A-Chip designer Harold Lee about the introduction of Jay Miner.

Alcorn and Lee had known about Miner because of his previous work on helping them with the "PONG-On-A-Chip" layout at Synertek. Now after setting up Synertek as a major secondary source for 6502 chip which was fast gaining popularity in the industry,

Alcorn used that as leverage for prying Miner away from Synertek. Promising large chip orders in the near future, as Atari began using the 6502 in coin-ops now as well, he was able to get Miner under an Atari badge. Decuir had already been notified after the February demonstration that he was moving down to Atari, and with Miner on board now he'd be apprenticing directly under the man Alcorn described as being "the best chip layout guy on the planet" at that time. Together they would be leading the transition from the Cyan proof of concept to a fully produced game console, complete with the first of its kind for a game console custom graphics chip. Larry Wagner was also added as head of software development, and he would eventually be in charge of hiring the programmers who did the first 10 launch games - many of which would form Activision.

The final hurdle

Most of the engineering for the Consumer Division, since it was still just a small group of people, was taking place amongst their Coin-Op Division compatriots. After all, Atari had just started its foray in to the consumer arena and its main bread and butter at that time was still arcade games. Alcorn knew that they needed to keep the revolutionary console a secret from competitors, but also more importantly from a lot of management. "My job was to keep the hounds away from these guys. To keep away the corporate bean counters and just let them do their job. Which was about fifty percent of my time." So he rented a secret location far away on Division Street to let the now expanded team do

their work. Of course that didn't last long, as without telling him, head of Coin-Op Engineering Steve Bristow rented the building right next door for Atari's new Pinball operations. Everything was in full swing.

"A HIGH QUALITY MACHINE WITH AN INCREDIBLE RANGE OF GREAT GAMES"

YOU REALLY NEED AN ATARI 2600

Under Jay Miner's leadership the 2600's architecture was formalized, restructuring the internal memory map, planned hardware registers, and making sure the synchronization between the 6507 microprocessor and the custom graphics chip was so tight that there was very little margin for error and less RAM (Random Access Memory) needed. RAM was extremely costly for the time, so the console would have to make due with the 128 bytes - yes, not even 1k of memory - on the 2600's third chip called RIOT (RAM-I/O-Timer) in order to be suitably sufficient.

The custom graphics chip had now been renamed Stella by Miner after seeing Decuir's use of it, and soon Miner's boss Bob Brown (who also reported to Alcorn) used it for the name of the entire project (interestingly, it's now the name of a popular Atari emulator). In the mean time, Miner and Decuir took the bare bones graphics processing done on the original prototype and began producing a gate level version which would be the exact version that would be carried over in to chip form. When completed in chip format, Stella was officially renamed TIA (Television Interface Adapter).

Debuting in stores on October 14th, 1977 with a set price of US\$199, Atari had sold out of its entire initial 400,000 unit production run to retailers for that Christmas season. The Consumer age at Atari had begun, and for millions of homes it was soon to be the Atari Age.

THE FILM CONNECTION

Sadly, a number of titles for the 2600 never saw the light of day and were to become a retro gaming myth. The classic hardcore skin flick, *Debbie Does Dallas*, was announced in 1982 by American Multiple Systems but was canned before completion; one can only wonder what the gameplay would have been like but it might have been similar to the Daley Thompson Decathlon joystick "waggle"... The cult comedy movie *Airplane!* was also canned as was *B-52 Bomber*. One game that definitely deserved to have been released was *Attack of the Baby Seals* - quite possibly a schlock b-movie horror title but one that sounds rather wondrous.

While a number of planned films did get cancelled, the Atari 2600 still managed a fair number of decent and not so decent adaptations. *E.T. The Extra Terrestrial* is now the stuff of legends, but the likes of *The Empire Strikes Back*, *Ghostbusters*, *Alien*, *Raiders Of The Lost Ark* and *Star Wars* proved that fun conversions of hit films were possible on Atari's machine.

» The Empire Strikes Back was a film adaptation that did appear on Atari's console. It's a cracking game as well, playing like Defender with AT-ATs.

ATARI 2600: PERFECT 10 GAMES

THE ATARI 2600 HAD AN INCREDIBLE AMOUNT OF GAMES AVAILABLE, COVERING ALL MANNER OF DIFFERENT GENRES. WITH THIS IN MIND WE'VE HAND-PICKED SOME OF ITS BEST TITLES FOR YOU. MISS THESE AT YOUR PERIL...

SPACE INVADERS

» RELEASED: 1980 » PUBLISHED BY: ATARI
» CREATED BY: RICK MAURERER

1 Don't be fooled by the ancient-looking visuals, *Space Invaders* was one of the earliest killer apps and proved a massive hit when it was first released on Atari's console. It may not be arcade perfect (there were only 36 onscreen invaders compared to the arcade's 55), but *Space Invaders* had plenty of different options, 112 in fact, which was a staggering amount at the time and greatly enhanced what was already a great game. Moving shields, zig-zagging bombs, invisible invaders, two players onscreen at once, guided missiles; the list was virtually endless, and it gave the game an endless amount of replay value. If you don't have a copy of *Space Invaders* in your collection then you're doing your Atari 2600 a huge disservice.

RIVER RAID

» RELEASED: 1982 » PUBLISHED BY: ACTIVISION
» CREATED BY: CAROL SHAW

2 *River Raid* was a huge departure for Carol Shaw; especially when you consider that the majority of her previous VCS games had been based on simple parlour games that didn't test the system.

The never-ending river you flew up was filled with a variety of dangerous hazards and the further you made it up the river, the more dangerous the challenge became (we didn't mind though, it looked amazing). Not only were you up against dangerous opponents, you also had a limited amount of fuel to worry about, which became scarcer and scarcer and the game progressed. A classic shooter that remains great fun to play.

BERSEK

» RELEASED: 1982 » PUBLISHED BY: ATARI
» CREATED BY: DAN HITCHINS

3 Like many 2600 arcade conversions, *Berserk* wasn't perfect. For starters, the voice synthesis from the arcade game was nowhere to be seen (although this was later added in an enhanced version), the graphics gave the game a more claustrophobic feel than its arcade parent and the enemies couldn't fire diagonally, thus making it easier to play. Despite these niggles it remains a great conversion mainly because of its simplistic gameplay and solid controls. Negotiating the mazes took steady nerves and a fair amount of patience and strategy. If you're a fan of shooters, track this down as quickly as possible.

ADVENTURE

» RELEASED: 1980 » PUBLISHED BY: ATARI
» CREATED BY: WARREN ROBINETT

4 *Adventure* is perhaps one of the crudest-looking games on the 2600. Your lead character was nothing more than a simple block, many of the rooms were sparse, even by VCS standards, and the less said about the dragons the better...

Nevertheless, it was one of the most involving titles available for Atari's first home console. With its simple premise (return a stolen chalice to a castle) and some great gameplay mechanics – several items can be picked up along the way to help your progress – *Adventure* remains a landmark title and an essential addition to any VCS library.

“ACTIVISION CERTAINLY CHURNED OUT SOME QUALITY TITLES FOR THE ATARI 2600 AND H.E.R.O. WAS NO EXCEPTION”

MAKE SURE YOU PLAY JOHN VAN RYZIN'S GAME

MS PAC-MAN

» RELEASED: 1982 » PUBLISHED BY: ATARI
» CREATED BY: MIKE HOROWITZ, JOSH LITTLEFIELD

5 Even the most avid 2600 owner will tell you that Atari's original *Pac-Man* was an appalling conversion. The game had obviously been rushed and disgruntled gamers poured scorn upon Atari. Atari had obviously been listening, though, as *Ms Pac-Man* was a huge improvement. While the visuals weren't arcade perfect, they captured the spirit of the original, and, this time around the main character actually looked like her arcade counterpart. Add in spot-on controls, faithful sound effects and near perfect gameplay that faithfully mimicked the arcade game and *Ms Pac-Man*'s success was assured.

H.E.R.O.

» RELEASED: 1984 » PUBLISHED BY: ACTIVISION
» CREATED BY: JOHN VAN RYZIN

6 Activision certainly churned out some quality titles for the Atari 2600 and *H.E.R.O.* was no exception. Taking control of Roderick Hero, the aim was to use your propeller backpack to venture into the 20 dangerous mines and rescue all the miners. *H.E.R.O.* was typical of many Activision titles in that it was very polished and featured some solid gameplay. While there was no actual music to speak of, there's a wealth of impressive effects that really added to the game's atmosphere and the ever-decreasing power in Roderick's jetpack ensured that every game remained a tense challenge. Great stuff.

DEFENDER II

» RELEASED: 1982 » PUBLISHED BY: ATARI
» CREATED BY: BILL ASPROMONTE

7 *Defender II* (or *Stargate* as it is also known) is another great arcade conversion for the 2600 and a damn fine shooter to boot. Unlike the original *Defender* (which was a pretty poor conversion) its sequel got everything correct and featured visuals that were extremely reminiscent of Eugene Jarvis's arcade hit. The action was fast and funous, sprte flickering was kept to a bare minimum and there were plenty of meaty sound effects to enjoy as you blasted away at alien sumc. When you consider that none of the original controls were sacrificed, you have yet another cracking title that certainly deserves a special place in your collection.

PITFALL II: LOST CAVERNS

» RELEASED: 1984 » PUBLISHED BY: ACTIVISION
» CREATED BY: DAVID CRANE

8 While the original *Pitfall!* is still a fantastic game, we constantly find ourselves returning to its superior sequel whenever we fancy participating in some jungle antics. Thanks to the cartridge containing its own chipset, the visuals in *Pitfall II* were very advanced for their time and were complemented by an extremely impressive soundtrack – indeed, technically *Pitfall II* remains one of the best-looking and sounding games that we've ever played on Atari's console. If you're looking for a tense platformer that constantly challenges you then *Pitfall II* should be tracked down at all costs. One of David Crane's finest moments.

ICE HOCKEY

» RELEASED: 1981 » PUBLISHED BY: ACTIVISION
» CREATED BY: ALAN MILLER

9 There were plenty of sports titles available on the Atari VCS, but few came close to the greatness of Alan Miller's excellent *Ice Hockey*. It's only two-on-two, and the graphics were rather simplistic to say the least, but none of that matters in the slightest as the all-important gameplay more than delivered. You had a surprising amount of control over both your players, the action was fast and furious and, once you got the hang of it, you could pull off shots from a variety of different angles. It was even possible to check opponents and send them crashing to the floor if you couldn't regain control of the puck. Another great Activision release.

THRUST

» RELEASED: 2000 » PUBLISHED BY: XTYPE
» CREATED BY: THOMAS JENTZSCH

10 There's an amazing array of home-brew titles currently available for the 2600, but Thomas Jentzsch's *Thrust* remains one of our favourites and shows off just what Atari's console can be capable of in the right hands. It was a great conversion of the original Commodore 64 classic and featured some very impressive visuals and a real sense of inertia that made it a joy to play. There was some fantastically smooth scrolling on display and the controls themselves were superb, meaning that you'd never blame them when you inevitably crashed into the desolate landscape. A smashing adaptation of an 8-bit classic.

ATARI 2600

AND THE REST...

Considering the massive popularity of Atari's first home console, it's perhaps unsurprising that it features such a diverse range of great (and downright awful) games. Here's just a selection of them...

- 01 Miniature Golf
- 02 River Raid
- 03 Earth Dies Screaming
- 04 Ghost Manor
- 05 Popeye
- 06 Moon Patrol
- 07 Texas Chainsaw Massacre
- 08 Zaxxon
- 09 Double Dragon
- 10 Beamrider
- 11 Haunted House
- 12 River Patrol
- 13 Gravitax
- 14 Asteroids
- 15 Mega Force
- 16 Rampage
- 17 Tapper
- 18 Amidar
- 19 Custer's Revenge
- 20 Gremlins
- 21 Marauder
- 22 Pitfall II: Lost Caverns
- 23 Pooyan
- 24 Stampede
- 25 Fantastic Voyage
- 26 Mario Bros
- 27 Phoenix
- 28 Snoopy and the Red Baron
- 29 Venture
- 30 Alien
- 31 Breakout
- 32 Frogger
- 33 Berzerk
- 34 Donkey Kong
- 35 Galaxian
- 36 Missile Command
- 37 Adventures of Iron
- 38 Combat
- 39 Joust
- 40 Pigs in Space
- 41 Radar Lock
- 42 Keystone Kapers
- 43 Space War
- 44 Pengo
- 45 Infiltrate
- 46 Mr. Do!
- 47 Coconut
- 48 Demon Attack
- 49 Ms. Pac-Man
- 50 Kangaroo
- 51 Q*Bert
- 52 Sky Skipper
- 53 Halloween
- 54 Canyon Bomber
- 55 Gorf
- 56 Jungle Hunt
- 57 Frostbite
- 58 ET: The Extra-Terrestrial
- 59 Gyruss
- 60 Shark Attack
- 61 Outlaw
- 62 Star Wars: The Empire Strikes Back
- 63 H.E.R.O.
- 64 RealSports Soccer
- 65 Ghostbusters
- 66 Burger Time
- 67 Mouse Trap
- 68 Sinistar
- 69 Centipede
- 70 Pac-Man
- 71 Road Runner

WHY THE ATARI 5200 WAS GREAT...

THE ATARI 5200 WAS NEVER GOING TO MATCH THE SUCCESS OF ITS ELDER BROTHER, BUT THAT DIDN'T MEAN IT WAS A COMPLETE FAILURE. SOME DECENT EXCLUSIVE AND SOLID CONVERSIONS HAVE ENSURED THAT ATARI'S UNDERDOG HAS BECOME A FIRM FAVOURITE WITH COLLECTORS OVER THE YEARS

» This planned deluxe controller featured an arcade-style trackball, for the full experience in the home.

The Atari 5200 may be unfamiliar to UK gamers, as it never saw a PAL release. What should have been the system to bring Atari into the Eighties, had it been released when originally proposed in the late Seventies, instead became a long and winding path to missed opportunities and bad execution. Stepping into the 5200's internal design gives the key to its origins and sheds some light on the troubled path it took as a concept and design, before it was finally released to market in October of 1982. Internally, the 5200 is an Atari 400 PCS (Personal Computer System) – the lower-end machine of Atari's late Seventies/early Eighties computer line – which is not a random fact being thrown at you when you take into account how the 400 was initially proposed.

"I love Candy"

Codenamed 'Candy', the Atari 400 was initially meant to be a lower-end game console to complement the higher-end 'serious' computer, codenamed 'Colleen'. The vision of the design team leader, Jay Miner, the new game console was to replace the team's previous console, the Atari 2600. Miner's idea was to leverage the new custom sound and graphics chips that they were designing, for a console with a keyboard directly on it, the idea being that game programmers would be able to develop right on the console itself, rather than the then-arduous process of developing on 6502 simulators running on time-sharing mainframes and then burning the games to an EPROM to test on the real thing. As team member Joe Decuir recalled: "We knew we would need to leapfrog the 2600 before somebody else did. It had to support home computer character and bitmap graphics. We saw the Apple II, Commodore, and Radio Shack appliance machines coming."

The 2600's time being limited was echoed by the slow sales that 1978 Christmas season and the rallying cry of Atari head at the time Nolan Bushnell. Bushnell

thought that, much like Atari's previous plethora of Pong machines, the 2600's time on the market was limited to around two years before the company had to introduce a new console. It was the same gut instinct that he had gone on since the early coin-op days of Atari, when to stay ahead of the 'me too' competitors it had to continuously innovate and release new machines or fall behind. Unfortunately – or fortunately, depending on how you look at it – Atari was a Warner Communications company now and not a private game-engineering firm. Warner's vision was one of stability for its company, and getting better sales out of its products on the market at the time.

It was a time when Atari itself was tanking, going from profits of \$40 million in 1977 to what would be just \$2.7 million in 1978. Bushnell being an absentee manager popping up with random directions and epiphanies didn't help, and in February 1978 Warner brought in a consultant to help make the company profitable again: Ray Kassar. Kassar and Bushnell spent the rest of 1978 butting heads, and Bushnell's stand at the Warner budget meeting that November would be his last. Getting in a shouting match with Warner's heads over drastically reducing the price of the 2600 to move it faster, they realised that he had to be completely taken out of the loop. After a feeble attempt to retain control of Atari by having a management meeting with Warner executives left out, the parent company decided to put Bushnell out to the corporate pasture, forcing him to retire.

By 1979, Kassar was in charge, and he put in place the idea to market the 2600 year-round, in direct opposition to Bushnell's plan – something executives at other videogame companies had been calling for since early in 1978. Atari also licensed the smash arcade hit Space Invaders, which, when released in 1980, gave the 2600 the shot in the arm it needed, and Atari was back up to \$80 million in profits for that year. Kassar also put into place his vision for Atari's new computer, and in the process axed the idea of a replacement for the 2600. Kassar's vision for Atari's computer line

» The inclusion of the ageing and unimpressive Super Breakout as the console's pack-in raised eyebrows.

was coloured by his former position at the textile manufacturing company Burlington Industries. Targeted towards mass consumer products like towels, carpets, and other woven products, Kassar felt his experience at Burlington gave him a keen sense of consumerism. He felt the computers should be developed and marketed as easy-to-use, consumer-oriented products in contrast to the overly technically inclined audience that home computer designers were then targeting. And although his suggestion during a meeting that the computers be marketed in different colours to attract housewives caused some Atari employees to quit on the spot, it turned out to foreshadow the way the market would go under Steve Jobs much later with his coloured line of iMacs.

The problem was, with how right Kassar had been on everything, Bushnell was also right. By 1980 what would be the 2600's biggest competitor, Mattel's Intellivision, would be launched nationally, followed by a blitz of ads showing the Intellivision's more detailed sprites and the advantages of its 16-direction controllers, all summed up by a snooty and arrogant George Plimpton showing side-by-side comparisons. Combined with the rise of a third-party market of 2600 games thanks to the defection of some of Atari's game programmers to form Activision, Kassar knew that the company had to do something or lose its grip on the industry. And the rest of Atari knew that it now had no choice but to work on a direct answer to the Intellivision.

Steve Bristow and a team of engineers began working on an update to the 2600, codenamed 'Super

Stella', 'Sylvia', the '3200', and even 'System X' at different times. They decided to bring the 2600's design more towards the new computer line by reproducing the format of the custom graphics chip team of GTIA and ANTIC.

Backwards compatibility

Keeping it backwards compatible with the 2600 was imperative, and accomplished by substituting the GTIA with an advanced version of the 2600's TIA graphics and sound chip called Super TIA or STIA. Likewise, System X was to get its own version of the ANTIC called FRANTIC, and the addition of a Votrax voice synthesis chip. It would also get a memory upgrade

from 128 bytes to a full 2K of memory, which was a big upgrade for 1980 and more in line with Intellivision's standards, if not more powerful when the ANTIC's

"WE KNEW WE NEEDED SOMETHING TO LEAPFROG THE ATARI 2600 BEFORE SOMEBODY ELSE DID IT"

JOE DECUIR ON THE IMPORTANCE OF CREATING THE ATARI 5200

display list technology was considered. The console and controllers would use an advanced wedge shape design form by designer Roy Nishi, which he was also using for the in-development remote control version of the 2600 called the Atari 2700. Unfortunately, System X only got as far as full schematics and a black box development unit, along with case and controller mockups, before it was scrapped. Apparently the guys in the Home Computer Division (HCD) were raising a ruckus over their technology being marginalised if the Super TIA would have gone all the way through development. In

a classic example of wasting time by running in circles, the push was made to use Atari's PCS technology.

Recycling the System X designation and some of the casing and controller work, in 1981 this new system's development started. This time, however, given the full support of Kassar and the Consumer Electronics Division (CED), all stops would be pulled to create a deluxe game system. Atari was intent on crushing Intellivision, and making an 8-bit system that would be a full arcade experience to the home.

The machines

First, the team started moving the entire multiboard PCS architecture to a single board system that would fit in the wedge-shape case form factor. This included keeping the unique four controller ports, but moving to a novel hookup scheme by combining the power and antenna cord into a single cable that attached to a combined antenna/power box. A setup that had not been seen since the RCA Studio II in 1977, Atari made it auto-switching – the very first console to do so.

Secondly, work was done to try to bring in controller features to compete against Intellivision's 16-direction keypad-driven controller, while providing the functionality for paddle-driven games that a digital controller simply could not support. The answer came in the form of a full analogue controller driven by two potentiometers, which when combined together would give a full 360-degree range of motion as well as provide accuracy for paddle games. It had the added benefit of being able to support velocity-tracking to control a character's speed of motion. The side-mounted buttons that featured on the original System X's controllers were split into two A and B buttons on each side. Finally, a full keypad was added to the controller's empty space to allow the extra input control expected in the more advanced games on Atari's computer systems. Besides the start and reset buttons, both also found on the PCs, a feature that gamers had been clamouring for was added as well: a pause button. This new controller was referred to as the 'Universal Game Controller', meant to imply that this was a deluxe controller – a luxury experience. The team leveraged the now-cancelled Atari 2700's console-based controller storage area, complete with flip-up smoked plastic lid to complement anyone's early Eighties entertainment centre.

The case itself also was updated to co-ordinate with the HCD's pending update to its computer line, the 1200XL, to give a unified look across the entirety of Atari's 1982 product line. In came glossy and matte

black plastic combined with a futuristic brushed metal inlay that gave it a very stylish look.

A bevy of peripherals were also planned. First and foremost was a keyboard expansion that was to plug in through a back expansion port, giving the 5200 some computer capabilities, including peripheral expansions. Second was a voice expansion module being designed by Milton Bradley for Atari, which would coincide with the version that it was designing for the 2600 as well. Third was a full four-voice, 48-octave musical keyboard with stereo output. Fourth was a full arcade-style 'Trak-Ball' controller, foreshadowing the type of in-home full-size arcade controllers used by MAME enthusiasts almost two decades later. Last was a 2600 compatibility module, which, contrary to popular myth, was planned from the beginning.

During much of the development, the system's internal name was changed to PAM (Personal Arcade Machine) before the final name was decided on prior to its public unveiling: the Atari 5200 Home Entertainment System. The move caused a change in the 2600's naming as well, just in time for its move to the all-black version affectionately known to collectors as the 'Darth Vader'

"DURING MUCH OF THE DEVELOPMENT, THE NAME CHANGED TO PAM"

THE ATARI 5200 WAS ONCE KNOWN AS THE PERSONAL ARCADE MACHINE

model. Previously referred to as simply the Video Computer System, it now became the Atari 2600. Atari also updated the console and game boxes to go with the new launch, with boxes for both systems using a silver motif. Additionally, game boxes received futuristic hologram stickers, remnants of the shut-down Atari Cosmos tabletop game project.

Atari was also very careful in its pending marketing strategy for the system to explain that the 5200 was not going to be a replacement for the 2600. At \$299.95, it was to be considered a high-end, state-of-the-art videogame system, with the 2600 and 5200 comprising "two home game systems in the

4. Best Electronics

www.best-electronics-ca.com/cx52_.htm

We've all heard about the problems with 5200 controllers breaking down. This is the best place to go for every single part needed to repair your precious controllers.

same spirit in which an automobile manufacturer builds different models to suit different tastes".

With press first going out in May of 1982 and the big intro at the June CES with a view to an October launch, things were looking great for Atari's new console. Or so they thought...

All fall down

In May, when Atari was announcing its next-generation system, another company thought to be long out of videogames surprised everyone. Coleco started announcing its own next-generation videogame system, the ColecoVision. Atari was caught completely off-guard and had to scramble to start a strategy against its new main competitor, once it was able to see the console at the June CES. Here it was, ready to kill Mattel and claim victory over the market by creating a new high-end niche while dominating the low end, and now the game had completely changed.

To make matters worse, during August and September focus groups were less than positive about the 5200's controllers. While many of the testers understood the possible advantages of learning to use the new controller format in the long run, most complained about the lack of resistance in the controllers, as well as the difficulty in playing four-direction precision games like *Pac-Man*.

Also, in direct side-by-side focus tests with the ColecoVision, testers thought games on both systems looked equally great, with Atari's only advantage being that the system's case and controller styling were more appealing. Media reviews had a similar outlook, with the addition of complaints that the initial launch titles were the same old games already on the 2600, including the surprise inclusion of *Super Breakout* as the pack-in game instead of one of Atari's more high-profile licences like *Pac-Man*.

Likewise, many of the planned expansions and peripherals became like roadkill on the road to market survival. CED's pride and competition against HCD caused it to want to make sure the 5200 was nothing like the Atari 400, and that it would never be mistaken for a computer. Axed were the keyboard expansions by the October launch, which soon after also led to the cancellation of the voice expansion for both the 5200 and 2600, and an eventual lawsuit from Milton Bradley.

Atari worked to rectify many of these faults, however, and managed to release a good number of new titles for the system over the coming year. It also managed to delay some games for its other platforms to make sure that the 5200 had a certain degree of exclusivity. By 1983, a revised two-controller-

port model was released with sturdier parts on the controllers and a new pack-in game: *Pac-Man*. It also dropped the odd single power/television cord in favour of a more traditional two-cable separate switchbox setup. However, by that time sales were already seen as lacklustre, and the console's future was being questioned, both inside the company and by numerous industry commentators.

To make matters worse, the 2600 module was absent almost the entire time, giving Coleco the advantage of backwards compatibility with the 2600 via its own module. By the time it appeared for the two-port model, owners of the older four-port version found that they couldn't use it, save for the few that were lucky to get the last revision before the move to the newer model.

A final cost-reduced version was being worked on, codenamed the 5100, which cut the physical size of the console in half and included new CX-52L controllers – especially designed self-centring joysticks with spring-loaded side buttons – but it never made it to market. By February of 1982, production of the 5200 was secretly ended. When Atari finally acknowledged it in May, it was ready to position the upcoming Atari 7800 as its replacement. As is well-known, however, Atari became a prominent victim of the North American videogame crash of 1982-1984, with the entire consumer division sold off to Jack Tramiel to form his Atari Corp.

Unknown to many collectors, Tramiel actually re-released the four-port 5200 version in 1985 in an effort to sell off his sizeable inherited back stock of products. Featuring cost-reduced packaging and a return to the Super Breakout pack-in, he also re-released many of the previous games in similar packaging. Tramiel brought to market several previously finished but unreleased games that were thought victims of the crash: *Gremlins* and the groundbreaking Lucasfilm titles *Rescue On Fractalus!* and *Ballblazer*. Actually generating strong sales for several years during this era of the NES, Sega Master System and Atari 7800, support for the 5200 was finally dropped by 1991, closing the book on what was once to be Atari's flagship console.

The design of the original System X 'Sylvia' hardware, sometimes known as the 3200, still holds retro appeal today.

ATARI INTRODUCES A NEW GAME!

This new ATARI® game is the future of home video games. It's a new generation of game cartridges that make full use of the power of the new system and are introduced in 1982.

These are the updated versions of some of our most popular games:

- SPACE INVADERS
- SPACE INVADERS II
- SPACE INVADERS III
- SPACE INVADERS IV
- SPACE INVADERS V
- SPACE INVADERS VI
- SPACE INVADERS VII
- SPACE INVADERS VIII
- SPACE INVADERS IX
- SPACE INVADERS X
- SPACE INVADERS XI
- SPACE INVADERS XII
- SPACE INVADERS XIII
- SPACE INVADERS XIV
- SPACE INVADERS XV
- SPACE INVADERS XVI
- SPACE INVADERS XVII
- SPACE INVADERS XVIII
- SPACE INVADERS XIX
- SPACE INVADERS XX

The new game will be matched with new classic program cartridges.

Of course, you'll also receive the new classic program cartridges that make full use of the power of the new system and are introduced in 1982.

These are the updated versions of some of our most popular games:

- SPACE INVADERS
- SPACE INVADERS II
- SPACE INVADERS III
- SPACE INVADERS IV
- SPACE INVADERS V
- SPACE INVADERS VI
- SPACE INVADERS VII
- SPACE INVADERS VIII
- SPACE INVADERS IX
- SPACE INVADERS X
- SPACE INVADERS XI
- SPACE INVADERS XII
- SPACE INVADERS XIII
- SPACE INVADERS XIV
- SPACE INVADERS XV
- SPACE INVADERS XVI
- SPACE INVADERS XVII
- SPACE INVADERS XVIII
- SPACE INVADERS XIX
- SPACE INVADERS XX

Along with some exciting new games, like:

- SPACE INVADERS
- SPACE INVADERS II
- SPACE INVADERS III
- SPACE INVADERS IV
- SPACE INVADERS V
- SPACE INVADERS VI
- SPACE INVADERS VII
- SPACE INVADERS VIII
- SPACE INVADERS IX
- SPACE INVADERS X
- SPACE INVADERS XI
- SPACE INVADERS XII
- SPACE INVADERS XIII
- SPACE INVADERS XIV
- SPACE INVADERS XV
- SPACE INVADERS XVI
- SPACE INVADERS XVII
- SPACE INVADERS XVIII
- SPACE INVADERS XIX
- SPACE INVADERS XX

ATARI 5200: PERFECT 10 GAMES

DUE TO UNFORTUNATE TIMING, THE ATARI 5200 DIDN'T HAVE THE LARGEST OF CATALOGUES. FORTUNATELY BOTH ATARI (AND LATER THE HOMEBREW COMMUNITY) RELEASED SOME TRULY FANTASTIC GAMES FOR IT

SINISTAR

» RELEASED: 2010 » PUBLISHED BY: ATARIAGE
» CREATED BY: JEFFREY P. MILHORN

1 The first coin-op game to inspire fear in gamers with its boss's demonic-sounding digitized voice, Atari was working on a port for its 8-bit computers when the company cancelled it due to the severe financial problems it had at the time. Almost completely finished save for some minor points, it remained a distant memory while passing through many hands over the years. That is until recently, when a 5200 homebrewer ported the game to the 5200 and AtariAge decided to make full productions complete with great label art. This stunning port truly shows off the 5200's capabilities of reproducing early Eighties arcade titles, and the gameplay is great, successfully re-creating the franticness of the arcade original.

MILLIPEDE

» RELEASED: 2002 » PUBLISHED BY: ATARIAGE
» CREATED BY: STEVE CRANDALL

2 Yet another victim of Atari's implosion, *Millipede* is a port of Atari's seminal follow-up to its monster 1980 hit, *Centipede*. Ready to go and even listed in the 1984 catalogue back in the day, its axing meant that gamers wanting to play *Centipede* would have to either purchase the 8-bit computer version or wind up having to suffer through a pretty terrible 2600 port. That is until AtariAge once again came to the rescue with a full re-production. *Millipede* is truly a joy to play with the 5200's Trak-Ball (yes, Atari spelled it with a "k"!); controller. The graphics and gameplay are spot on, with even the animated title screen re-created perfectly.

BALLBLAZER

» RELEASED: 1986 » PUBLISHED BY: ATARI
» CREATED BY: LUCASFILM

3 *Ballblazer* was one of Lucasfilm Games' first titles. Taking full advantage of the 8-bit computer and 5200's scrolling capabilities, Lucasfilm managed to create a beautiful futuristic 3D 'soccer' match complete with continuous fractalised music. Because the partnership was such a big deal, Atari wanted to hold off the computer release to give the 5200 and then the 7800 some exclusivity. Unfortunately it wound up backfiring, and the company imploded during the interim, leaving 5200 owners having to wait until Jack Tramiel revived 5200 sales in 1986. Some would say it was certainly worth it though.

MS. PAC-MAN

» RELEASED: 1983 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

4 What can be said about this bow-wearing beauty that hasn't already been said? Well how about that the 5200 port is an extremely solid re-creation of her arcade appearance complete with all the fun intermission animations and different levels? This Atari conversion is a massive step up from the earlier-released *Pac-Man* for the 5200, as this time around the programmers concentrated more on re-creating the overall faithfulness of the arcade game rather than just the speed of the original. A very solid conversion that's definitely worth tracking down if you are a fan of the arcade version.

**"ANOTHER FANTASTIC ARCADE
CONVERSION THAT 5200 COLLECTORS
SHOULD IMMEDIATELY SEEK OUT"**

DON'T MISS ROBOTRON: 2084

ROBOTRON: 2084

» RELEASED: 1983 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

5 What can get crazier than a session of Eugene Jarvis and Larry DeMar's classic in the arcade? How about a near-perfect port at home complete with dual joysticks? The 5200 version shipped with a special joystick coupler that enabled you to use both of the 5200's controllers to play the game as it was meant to be played. The looser feeling of the 5200's analogue sticks truly makes the fast multi-directional twitching a breeze to carry off. Some even like playing it on here better than the original. Another fantastic arcade conversion that 5200 collectors should immediately seek out.

STAR RAIDERS

» RELEASED: 1982 » PUBLISHED BY: ATARI
» CREATED BY: JOE COPSON

6 You simply can't say you've experienced gaming on any Atari platform until you've spent time playing this classic. Designed for Atari's computer line in 1979 to show off their advanced capabilities, it was popular enough to later port to the Atari 2600, 5200, ST, and even inspire a graphic novel by DC comics. You're treated to a first-person view of a cockpit going through space, reminiscent of Exidy's Seventies classic *Star Fire*. With gameplay similar to the classic *Star Trek* text game, you go from sector to sector (via your trusty galactic chart) clearing each of those pesky Zylon ships. An instant classic that shouldn't be missed.

CASTLE CRISIS

» RELEASED: 2004 » PUBLISHED BY: SELF-PUB
» CREATED BY: BRYAN EDEWAARD

7 *Castle Crisis* is a homebrew game by veteran programmer Bryan Edewaard, and fans of the multiplayer coin-op favourite *Warlords* will be happy to learn this is a graphically arcade perfect port of that game, even though it doesn't share the same name as Atari's superb coin-op. Which you would expect considering the arcade version ran on virtually identical hardware. The Atari 5200's analogue controllers are simply perfect for the precision needed to break out a pair of spinners, which is a problem that plagued many of the earlier ports of this game when it appeared on other home consoles.

ADVENTURE II

» RELEASED: 2007 » PUBLISHED BY: SELF-PUB
» CREATED BY: RON LLOYD

8 No, this isn't like Dana Marsch's Hamlet 2. Atari 5200 homebrewer extraordinaire Ron Lloyd managed to create a legitimate follow-up to the hit 2600 classic, to the point of Atari giving its blessing in exchange for using it to create a scaled-down 2600 version for their Flashback 2 console. Keeping the fun gameplay of the original but vastly updating the graphics, *Adventure II* also includes plenty of new locations and foes to test you. It's worth it to pick it up for the beautiful graphics alone, but the additional updates and expansions make this a fantastic game for the 5200. An essential addition to any collection.

KOFFI: YELLOW KOPTER

» RELEASED: 2002 » PUBLISHED BY: SELF-PUB
» CREATED BY: RON LLOYD

9 Another homebrew classic by Ron Lloyd, this is a completely original game featuring a cartoonish yellow helicopter. Like a chopper version of Rudolph the Red Nosed Reindeer, Koffi is not allowed to go with the bigger rescue 'kopters' on missions. But when he learns of an insidious plan by Pyro the Storm Cloud to burn down the forests, Koffi flies into action to protect the woodland and the animals that live there. In a take on US Games' 'Name This Game' contest for its 2600 game release in 1982, AtariAge forum members were allowed to enter a contest to design one of the animals appearing in the game. This needs to be owned.

BEEF DROP

» RELEASED: 2004 » PUBLISHED BY: SELF-PUB
» CREATED BY: KEN SIDERS

10 Mattel was responsible for porting Data East's coin-op classic *Burger Time* to the Intellivision (which is considered an excellent port), and its M-Network Publishing ported it to the Atari 2600, Apple II, and IBM PC. Unfortunately, the 5200 had zero chef love, which was a real shame. Thanks to Ken Siders, however, burger-loving 5200 owners can now build them all day long. Initially unveiled under the guise of an April Fool's joke surrounding a "found" prototype, Ken thankfully soon revealed that he had coded it up and was soon looking to publish it as the complete game. *Beef Drop* is the excellent end result.

ATARI 5200 AND THE REST...

The Atari 5200's library of games may be small, but there are still plenty of great arcade conversions and original games to discover on it. Screenshots courtesy of www.atariage.com

ATARI 800XL

BROADLY CONSIDERED THE FINEST ALL-ROUNDER IN ATARI'S 8-BIT HOME COMPUTER RANGE, THE 800XL WAS ALSO THE BIGGEST SELLER IN GLOBAL TERMS. BUT DESPITE TOP-CALIBRE SOFTWARE SUPPORT FROM THE LIKES OF LUCASFILM, EA AND EPYX, IT NEVER PENETRATED THE HOME-COMPUTING MARKET TO THE EXTENT OF ITS NEAREST RIVAL, THE COMMODORE 64. MIKE BEVAN TAKES A RETROSPECTIVE LOOK AT THE HISTORY OF ATARI'S UNDERACHIEVING 8-BIT

In the fifth issue of fondly remembered C64 magazine *Zzap!64*, which hit newsstands in September 1985, Archer Maclean penned a tips guide for his classic shoot-'em-up *Dropzone*, which contained the oft-quoted (and misquoted) following comment. "The Atari, being the Porsche of home computers is capable of running *Dropzone* 2.5 times faster than the 64 and can handle any amount of blobs on screen. However, the 64 is still a respectable BMW 316 (S reg)." It was an unusual statement to find in a Commodore-oriented publication, and while Retro Gamer prefers to remain neutral in any debate regarding the technical superiority of either of the two competing machines, Archer may well have had a point. Especially as Atari's home micro was far better than many often said it was.

The comparison game

Compared to the more popular home computers of the day, such as the ZX Spectrum and C64, Atari's computers were often regarded as high-end, and came equipped with an equally high-end price tag. In 1984, the newly released Atari 800XL, the computer designed to compete with the C64, was priced at around £250, considerably cheaper than its older sibling, the Atari 800, which had been on launch in the US, but far more expensive than the Spectrum (£130) or C64 (£199). A higher price point than the more popular machines, and an over-reliance on the expensive cartridge format plagued Atari computer software. However, many classic games that originated on the Atari 8-bit computers, were faster and more refined than the now often better-known conversions on other contemporary platforms. But by the mid-Eighties, Atari had found to its cost that high-quality software, flashy technical specifications and above average build-quality simply wasn't enough to win in the fight for the hearts and minds of hobbyists and computer dealers whose main concern was competitive pricing.

In hindsight, Atari's relative failure with its 8-bit home computer range, at least in terms of longevity compared to its rivals, seems harsh when you consider that they were very much ahead of their time in conception. Work began on the company's first two home computer systems, the Atari 400 and 800, after the release of the 2600 console in 1977. "We knew we needed to leapfrog the 2600 before somebody else did," says Atari designer Joe Decuir. "We saw the Apple II, Commodore and Radio Shack machines coming, and we wanted to design a machine that would support home computer characters and bitmap graphics." Another member of the 400/800 dev team was Jay Miner, future 'Father of the Amiga', who headed design of the graphics display/output chips known as ANTIC

INSTANT EXPERT

Atari 800XL

- The Atari 800XL was one of the third generation of Atari 8-bit home computers, and was preceded by the Atari 400, 800 and 1200XL. It is backwardly compatible with most software. It was Atari's bestselling 8-bit computer system worldwide.

- Atari's home computers were the first to use special custom processors for graphics and device input/output, which freed up the main CPU for other tasks, a concept used by developers Jay Miner and Joe Decuir, on leaving Atari, for the design of the Amiga.

- The Atari 8-bit computers were based on a 1.79MHz 6502 CPU, a considerably faster clock speed than its competitor, the C64, which had a 1MHz 6502 processor. As a result many maths-intensive titles, such as *Rescue On Fractalus!*, were faster on Atari machines than on the C64.

- The 800XL had a little brother, the Atari 600XL, which was effectively the same machine but came equipped with 16K RAM, as opposed to the 800XL's 64K, and lacked the 800XL's composite video output.

- The custom graphics chips in the 600XL/800XL computers were called ANTIC and GTIA, and offered sprite handling, advanced hardware scrolling and collision detection, and up to 256 colours (as opposed to the C64's 16-colour palette).

- Four sound channels were available, originating from the Atari 800XL's custom POKEY chip, which also handled peripheral input/output. It was co-designed by Star Raiders creator Doug Neubauer.

- A number of classic cross-platform 8-bit system games were initially programmed for Atari computers, including *Ballblazer*, *Rescue On Fractalus!*, *M.U.L.E.* and *Archon*.

and CTIA. A third custom chip (POKEY) handled peripheral input/output and sound, and these separate co-processors freed up the main CPU, improving performance. An industry first, the concept of separate dedicated chips to drive graphics and sound would be taken to its logical extreme when ex-Atari employees, including Jay, were hired by Commodore to produce its first 16-bit home computer a few years later.

WHY THE ATARI 800XL WAS GREAT... OF ALL OF ATARI'S 8-BIT HOME COMPUTERS IT WAS THE MOST COMPETITIVE ALL-ROUND PACKAGE, WITH A FULL 64K RAM, BUILT-IN BASIC, GREAT AUDIO/VISUAL CAPABILITIES AND A DECENT, COMPACT CASING AND KEYBOARD. PROGRAMMERS LOVED THE QUIRKS AND CUTTING-EDGE CAPABILITIES OF ATARI'S HARDWARE, AND SOME OF THE GAMES SOFTWARE IT SPAWNED WAS TRULY GROUND-BREAKING. MUCH OF THE TECHNICAL KNOW-HOW GAINED IN THE DESIGN OF THE ATARI 8-BIT LINE WENT ON TO BE USED IN THE AMIGA, AND EVEN TODAY'S PCS.

Advertisements for the early Atari 8-bit computers publicised the systems' cutting-edge graphic capabilities and advanced sound compared to those of rival machines.

Two generations of Atari personal computers. The Atari 400 (top), Atari 800 (middle) and Atari 1200XL (bottom).

The launch

Debuting in the US in autumn 1979, the Atari 400 and 800 computers sold for \$549 and \$999 respectively. The 400, with its membrane keyboard was geared towards the home hobbyist and games market and was intended to ship with 4K of RAM. The 800 was designed as a higher-end or business machine, and came equipped with 8K of memory. Both computers were capable pieces of hardware for their time, sporting an unprecedented 128-colour palette, hardware sprites, four joystick ports, and cartridge, peripheral and memory expansion interfaces allowing unheard of levels of customisation. By the time of its launch, falling RAM prices allowed Atari to increase the 400's memory

capacity to 8K. Eventually the 400/800 shipped with a standard 16K or 48K of RAM respectively.

Atari's marketing division made considerable efforts to publicise the advanced audio-visual features of its home computer systems, focusing on their unique custom architecture, fast full-colour graphic capabilities and multi-channel sound. Atari CEO Ray Kassar's mandate to the company's design engineers had been that the systems should be invaluable for home and business use and have the capabilities to play exciting,

cutting-edge games. Unfortunately, the company's reputation as a videogame manufacturer backfired on its Home Computer Division, as high-end consumers opted for the more business-like Apple II rather than the Atari 800, and gamers found the high cost of the 400 prohibitive compared to the cheaper VCS console. However, Atari did have one considerably powerful ace up its sleeve to lure gamers to its 8-bit computer line.

Doug Neubauer, an Atari engineer and co-designer of the POKEY chip, had developed a game while

The machines

• The walking Atari Robot demo, which adorned many a computer shop window, demonstrating the impressive colour palette of the Atari computers.

working at Atari. Inspired by the generic 'Star Trek' games he'd seen running on mainframe systems, Doug took advantage of the new Atari hardware, which he describes as "a quantum leap from the 2600" to update the game with a first-person 3D perspective. Not a huge logical progression by today's standards, except for one fact. No one had ever created a full free-roaming 3D game before. The result, *Star Raiders*, was staggering when first experienced in 1979 as one of the launch titles for Atari's personal computers. It became one of the first examples of a home computer 'killer-app' with many customers purchasing a 400 or 800 and a *Star Raiders* cartridge just to enjoy Neubauer's creation, among them a youthful Archer Maclean. "I saw *Star Raiders* and it

**"YOU CAN KEEP YOUR ELITES
AND WING COMMANDERS.
FOR ME STAR RAIDERS WILL
ALWAYS BE THE BEST"**

JEFF MINTER IS CLEARLY A FAN

just blew me away," he says. "Something very special was happening. I made it my mission to find out what."

Another fan, Jeff Minter, couldn't wait to play it. "You can keep your *Elites* and *Wing Commanders*, for me the original *Star Raiders* will always be the best. 8K of sheer 6502 code poetry," he eulogises.

A further coup came in 1982, when LucasArts (then Lucasfilm) agreed to produce its first two hotly anticipated games, *Rescue On Fractalus!* and *Ballblazer*, exclusively for Atari machines. Both were developed on the Atari 800. "They wanted us to develop for the 2600 since it was their biggest installed base, but we were able to convince them we could do much more impressive games on the newer systems," says *Fractalus!* designer David Fox. "The target platform, initially, was the 5200. The other competing platforms at the time were the Apple II and C64," he continues. "The C64 didn't have much of an installed base then, but the Atari had a great set of chips, allowing us to squeeze a lot more out of the machine than we could on a computer like the Apple, which really had nothing like that." Ultimately, Lucasfilm's titles weren't enough to push Atari's computers into mainstream popularity, not being released until several years after the 5200 versions, and after the C64 had started to emerge as the 'it' machine for consumers. Lucasfilm eventually conceded and converted its games to the C64 and other platforms.

Around the time of the Lucasfilm deal, Atari was set to launch a successor to its 400/800 computers, with which it planned to phase out the older systems and boost flagging sales. Hitting shelves in January 1983, the Atari 1200 was intended as a more 'adult' computer system, and built on the successful 400/800 architecture, adding a professional-looking keyboard,

Atari's 1981 computer product-line-up, with the 400 and 800 personal computers taking pride of place in the centre of the picture.

OTHER VERSIONS

Atari 65XE

This replacement for the 800XL, launched in 1985, features sleeker styling, an updated version of Atari BASIC, and a new memory management chip called 'Freddie'.

There's little to make it a better buy nowadays than its predecessor, although its very similar big brother, the 130XE, is worth considering.

XE Game System

Released in answer to Nintendo's NES, this was a modified 65XE computer in console guise (more contemporary looking than the

rather dated 5200 console). Add-on features included a detachable keyboard, which was a little 'mushy' in comparison to those of the computer line, and a light-gun. It came with *Missile Command* and Atari BASIC built-in.

Atari 800XE

The last 8-bit computer to be produced by Atari, the 800XE was almost identical to the 800XL, but with the slim-line casing

of the 65XE/130XE computers. It has other similarities to the 65XE, such as the inclusion of the 'Freddie' chip. The 800XE had a short life span, and was sold for only a year.

64K of RAM and improved peripheral support. The machine used a new graphics co-processor (GTIA) with an improved 256-colour palette. This had recently replaced the older CTIA chip in the 400/800 series and would be used in all future Atari 8-bit models. Designed to compete directly with the Apple II, the machine was unsuccessful in the competitive and soon-to-be-crowded market for business systems. There were also compatibility problems with some 400/800 software titles due to the 1200XL's upgraded BIOS. The unpopularity of the 1200XL drove sales of the 800 as consumers raced to purchase the cheaper machine before it was discontinued. The system was an embarrassing flop for Atari, retailed for just four months before the plug was pulled on production. It was never sold outside the US.

Tim McGuinness, Atari's assistant director for corporate research engineering at this time, was a major player in the design of the 1200 and the later XL models. "Before the release of the 1200XL, Atari had VisiCalc, a few great databases, and a good word processor. In fact, many employees at the company used Atari 800 computers for all business work. But the early Ataris were marketed as home computers and by late 1982 we were months from the release of the IBM PC and first Compaq 'Lunchbox' PC."

PROJECT WIZARD

Atari's hard-working engineering department always strived for an experimental approach to design, although a number of ambitious and unusual research projects only ever reached prototype stage. One was Project Wizard, an incredibly strange concept that would have caused somewhat of a stir in the industry had it ever seen the light of day. "It was the first, and only game controller that used your mind," says research engineer Tim McGuinness.

It was created in 1982, and was one of my projects. It used three electrical sensors on the forehead to control right-left motion of the cursor, and was designed for games like *Breakout*. 1,000 pieces were manufactured under the Atari Wizard Controller name for the Home Computer & VCS lines, but were never released for sale. But it was so cool. You put on a headband with three sensors, and you willed the controller right and left – it took about 10 minutes for most people to get control. Some could control it with blinding speed. I think the main reason it didn't go on sale was the psychological stigma of a computer reading your mind. It actually worked using simple electrical signals, through the skin, but I believe that was the factor. Especially in those days, when the public had no idea of how limited the power of their computers was..."

The end is nigh

Despite the lack of consumer support for the system, Tim remains proud. "The 1200XL was the big step up from the 800/400 series," he says. "Later systems such as the 800XL were lesser progressions from an evolutionary standpoint." In fact, the machine may have been better received had Atari not been struggling financially. "The company was falling apart in the US, as the major corporate marketing engine was dealing with the collapse of the VCS console market. The home computers were a poor stepchild," says Tim.

In 1983, Atari went for the low end market with the Atari 600XL and 800XL computers. Externally quite similar to the 1200XL, but abandoning the function keys and built-in demos, they were the first machines to include in-built Atari BASIC as standard. The 600XL/800XL came equipped with 16K or 64K RAM respectively and had two joystick ports. The Parallel Bus Interface (PBI) was added, allowing the addition of advanced peripherals. The machines were very much scaled down versions of the 1200XL, and to reduce production costs further following Jack Tramiel's takeover of Atari in 1984, much of the manufacturing was moved to Hong Kong. The price cutting was to try and directly undercut Commodore, who had ejected Tramiel earlier in the year. However, production delays had meant that most of Atari's stock of 600XL/800XL machines had hit retailers too late to compete against the C64 over the Christmas 1983 period, and Atari never managed to catch up with its rival from this point on. Coupled with the collapse of the 2600, Atari was on a slippery slope, and would never again scale the heights of its ascendancy under founder Nolan Bushnell. Despite these problems, the Atari 800XL remains the company's most successful 8-bit computer.

Atari soldiered on under Tramiel with some modifications to its 8-bit computers, such as the XE range and the XE Game System, released in 1987 as a competitor to the NES. In 1992, with its 16-bit ST home computer locking horns against Commodore's Amiga,

Third-party support from publishers like Synapse, Epyx, DataSoft, First Star and Sierra was a great boost to the Atari home computer software catalogue.

Atari finally dropped all support of its 8-bit line, 15 years after the series' conception and long past the peak of its popularity. Brilliant and technically ahead of their time, Atari's 8-bits desperately tried to be jack of all trades but fell short of winning the battle against both Commodore and Apple. Perhaps their potential as a gaming platform was never quite realised, which is something of a pity. "Although the Apple II was the obvious target, we also conceived of the 800 as the next-generation gaming machine," says Joe Decuir. "In my opinion it had no peer until the NES came out five years later in Japan." Adds Tim McGuinness: "We still use Atari technology in today's PCs. Our MS DOS floppies use Atari DOS format. USB is the grandson of Atari Serial." Now that's certainly something to think about.

DE RE ATARI

A long-held popular myth is that Atari deliberately held technical information on its 8-bit computers from third-party programmers, so that its internal developers would have an advantage. It's a rumour that ex-Atari software developer Chris Crawford (of Eastern Front fame) is eager to quash. "When the 400/800 were released, Atari executives assumed that the technical details of those machines would be kept secret, as they were with the VCS. Everybody in engineering knew that was absurd, but it took a while to convince them it would be better to encourage outside software developers. What did the trick was the early press reviews saying that the 400/800 were great machines but didn't have as much software as the Apple II.

In December 1979, they issued a memo saying all technical documentation was now publishable. I had a number of friends in the software community and got on the phone to them. They wanted photocopies of the documentation, which I ran off myself and shipped to them. Thenceforth, all you had to do to get the documentation was to ask. We sent out exactly the same documents that we ourselves used. There was never any attempt to hold anything back after that. However, the documentation was not easy to understand. By December 1980 there were enough developers that I proposed a Software Development Support Group, to assist developers both inside and outside Atari. We wrote De Re Atari to make the documentation easier to understand."

This legendary tome, published in 1982, was an invaluable aid to programmers like Archer Maclean, who likens reading it prior to creating Dropzone to a 'religious experience'. "If we'd started the Support Group sooner I think we could have beaten Apple to become the top 8-bit machine, and fended off the C64," says Chris. "But we didn't. If we'd beaten Apple, I might not be typing this on my Macintosh!"

COMMUNITY

THE BEST ATARI WEBSITES

Atarimania

www.atarimania.com

A fabulous resource, in a similar vein to World of Spectrum and Lemon64, this site is a wonderful place to start for an overview of Atari 8-bit hardware and software. Atarimania has an enormous database of downloadable games and software, with screenshots and full-colour manual scans for many titles. It also features the occasional developer interview.

Atari Museum

www.atarimuseum.com

A massively impressive site, with a whole wealth of information covering Atari's 30-year history. Its archives are brimming with first-hand interviews with Atari staff, technical documents, Atari magazine scans, old adverts and press releases, and a bucket-load of other assorted resources. You name it and, if it's Atari-related, it will probably be here.

Back In Time

www.backintime.net

Another large Atari-oriented site with information and photos of pretty much every console and home computer model ever released by the famous company, along with features on official and third-party add-ons, and peripherals and unreleased prototype hardware. Check out the radio-show episodes featuring guests such as Sid Meier and Nolan Bushnell.

ATARI 800XL: PERFECT 10 GAMES

THE ATARI 8-BIT PERSONAL COMPUTERS WERE PRIVY TO SOME OF THE MOST IMPRESSIVE GAMES OF THEIR TIME, AND THE ATARI 800XL IS STILL A GREAT PLATFORM ON WHICH TO EXPERIENCE THEM. HERE ARE OUR FAVOURITES

STAR RAIDERS

» RELEASED: 1979 » PUBLISHED BY: ATARI
» CREATED BY: DOUG NEUBAUER

1 Hugely influential to many of those that witnessed it on Atari's fledgling personal computers, *Star Raiders* was the title responsible for shifting more Atari 400/800 machines than any other. The granddaddy of the *Elite*-style 'space opera', it was also the world's first free-roaming first-person perspective game. Updating the generic 'Star Trek' games played by many a college student on mainframe systems, it was a striking mix of strategy and fast, immersive graphics that effortlessly sucked players into its universe. Criminally, the game's creator, Doug Neubauer, didn't make a single penny from *Star Raiders*, which he created in his spare time while he was employed as an Atari design-engineer. An instant classic that must not be missed.

ENCOUNTER

» RELEASED: 1983 » PUBLISHED BY: NOVAGEN
SYNAPSEN » CREATED BY: PAUL WOAKES

2 *Encounter* was so good that when Jeff Minter first saw the game demoed at a computer trade show he hastily convinced author Paul Woakes to make it a full commercial product, giving birth to software house Novagen and paving the way for *Mercenary*. Playing out the mechanics of *Battlezone*, at what seems like around a thousand miles per hour, and with filled, solid objects zooming in and out of the screen, *Encounter*! was a technical marvel. And the impressively scary 'warp-sequence' between levels, which flings hundreds of enormous Ping-Pong balls at you while you struggle to avoid a collision, will still leave you squirming.

RAINBOW WALKER

» RELEASED: 1983 » PUBLISHED BY: SYNAPSE
» CREATED BY: STEVE COLEMAN

3 *Rainbow Walker* is a unique and extremely playable title that is totally exclusive to the Atari 8-bit systems. Borrowing the colour-filling mechanics of *Q*Bert* and transposing them onto a chequered pseudo-3D scrolling play-field, its impressive z-axis scrolling utilises the Atari's unique graphic capabilities very nicely. Guiding our rotund hero Cedric across a series of aerial platforms fills in squares with a spectrum of colours, and moving up or down at either vertical extremity scrolls the patterned play-field towards or away from you. Enemy creatures can, and will, undo all of your hard work and must be avoided or 'pushed' off the scrolling rainbow.

PASTFINDER

» RELEASED: 1984 » PUBLISHED BY: ACTIVISION
» CREATED BY: DAVID LUBAR

4 Despite a limited release by Activision (it remains one of the hardest titles to track down), *Pastfinder* is a great progressive shoot-'em-up which makes good use of the Atari's unique hardware. Helming a frog-like craft (the 'Leeper') your task is to explore a hostile planet while hunting down long-lost alien 'artefacts'. The scrolling forced-perspective terrain (resembling a top-down *Zaxxon*) is highly atmospheric, with great use of shadows, and the Leeper is a wonderfully charismatic creation with a superb control 'feel'. There's a huge *Star Raiders*-style strategy-grid to traverse in search of ancient loot, making David's game superb fun.

"THE DEFINITIVE VERSION OF THE GAME, RUNNING FASTER THAN THE COMMODORE 64 CONVERSION"

GET THIS VERSION OF RESCUE ON FRACTALUS!

BOULDER DASH

» RELEASED: 1984 » PUBLISHED BY: FIRST STAR SOFTWARE » CREATED BY: PETER LIEPA

5 At the risk of being predictable we couldn't really leave *Boulder Dash* out of our Perfect Ten. Developed for the Atari 400/800 by Peter Liepa and Chris Gray, its beautiful gameplay (inspired by *The Pit*, an arcade game co-created by Andy Walker of Taskset fame) has been enthralling generations of gamers on various platforms for over 20 years, and its hero, Rockford, is a bona fide gaming icon. The dynamic physics, the predetermined 'rules' for enemy creatures, and the thought-provoking puzzle-like nature of the game were all masterstrokes, making Peter Liepa's game a true classic that never gets old.

DROPTZONE

» RELEASED: 1984 » PUBLISHED BY: US GOLD » CREATED BY: ARCHER MACLEAN

6 With *Dropzone*, a young Archer Maclean took a large helping of *Defender*, a sprinkling of *Jetpac*, and cooked up a brilliant and blisteringly paced Jarvis-esque mega blast. Like a fine wine, *Dropzone* has aged remarkably well, and the original Atari version is most definitely the finest vintage on offer. Considerably bettering Atari's already very decent *Defender* conversion, Archer's magnum opus displays an incredible eye for detail and pushes the Atari hardware to the limit with its incredibly rapid smooth-scrolling, pixel-perfect collision handling, incredible particle effects and fantastic playability. A fantastic, hectic blaster.

RESCUE ON FRACTALUS!

» RELEASED: 1985 » PUBLISHED BY: ACTIVISION/EPYX » CREATED BY: LUCASFILM GAMES

7 If *Star Raiders* managed to shoehorn a small but significantly impressive corridor of space into an 8K Atari cartridge, *Rescue On Fractalus!* went a step further by cramming a whole planet into a 48K computer. Lucasfilm's first-person fractal flight-sim delivered an incredibly immersive experience, which many thought impossible to achieve. Its release was a defining moment for the Atari 8-bit systems it was originally designed for, wowing gamers on their first exposure to its amazing real-time landscape. The Atari's faster processor means that this is the definitive version of the game, running faster than the C64 conversion.

BOUNTY BOB STRIKES BACK

» RELEASED: 1985 » PUBLISHED BY: BIG FIVE SOFTWARE » CREATED BY: BILL HOGUE

8 Bill Hogue's excellent sequel to his classic *Miner 2049er* is an outstanding platformer that improves on its predecessor by some distance. Bob's mine now has a satisfyingly solid isometric angled look, and there's a multitude of new contraptions to help (or hinder) our hero. With 25 stages (more than twice the number of the original), and some extremely devious screens with a proliferation of slides, pipes and teleports to scramble your brain, *Bounty Bob Strikes Back* will test your platforming skills to the max but have you coming back for more. An excellent platformer that simply gets better with age.

THE EIDOLON

» RELEASED: 1985 » PUBLISHED BY: ACTIVISION/EPYX » CREATED BY: LUCASFILM GAMES

9 Probably the most ambitious, original and downright atmospheric title of Lucasfilm's fractal triptych, *The Eidolon* was scaring the nappy-filler out of gamers many years before *Doom* or *Resident Evil* were. By cleverly inverting the fractal mountains from *Rescue On Fractalus!* and *Koronis Rift*, Charlie Kellner created an incredibly engrossing first-person subterranean adventure with strange revelations and fascinating beasties lurking around every corner. The creatures themselves are all great characters, from comical lowly minions to the game's famously impressive dragon guardians, and still send shivers down your spine.

YOOMP!

» RELEASED: 2007 » PUBLISHED BY: N/A » CREATED BY: MARCIN ZUKOWSKI AND TEAM

10 Imagine playing *S.T.U.N. Runner* (apparently we're not supposed to mention *Trailblazer*) with a bouncing ball in a psychedelic tubular playing field to a stonking soundtrack. Actually, imagine no more, just grab *Yoomp!* instead. This excellent title was created by a Polish programming team, and was inspired, according to its developers, by an old Bullfrog DOS game called *Tube*. Whatever its influences, however, this freeware masterpiece deserves to be played by as many players as possible, which is why we've included it here. Fire it up, grab a joystick, disengage your mind from the niggling background music and enter the zone.

ATARI 800XL

AND THE REST...

With so many British gamers constantly harping on about the ZX Spectrum, CPC 464 and Commodore 64, it's easy to forget that there were plenty of other classic machines that were worth visting, as this two-page 800XL spread proves. How many did you play?

ATARI 7800

THE ATARI 7800, ONCE THOUGHT OF AS THE SAVIOUR OF ATARI, WAS A VICTIM OF POOR TIMING. MARTIN GOLDBERG REVEALS HOW IT MEANT TO LAUNCH THE NEXT GENERATION OF 8-BIT CONSOLES, BUT ULTIMATELY BECAME AN 'ALSO-RAN' IN THE POST-CRASH ERA

The company responsible for the 7800's internals, General Consumer Corporation (GCC), had first come to the attention of Atari in June of 1981. *Missile Command* had

been very popular on campus, until some obsessive students began scoring too well on the game. In typical smart guy hacker fashion, and long before today's common console mod kits, three MIT students decided to modify the arcade game to make it harder. Feeling a sense of entrepreneurial drive, they came up with the idea of making a standard kit out of it and selling it, giving arcade operators the ability to breathe new life into their ageing *Missile Command* machines in the form of new gameplay items and difficulty settings, which greatly added to the longevity. So that June they started advertising, and by July Atari was already launching a lawsuit and, by August, a restraining order.

Most companies would have folded right there, but not GCC. They were MIT students, after all, and had a strong sense of being smarter than the average guy. Their defence against Atari's suit would be just another interesting puzzle or challenge – things that are entertaining to them. After going several rounds with GCC in federal court, realising that it may be better to tap the talent pool at GCC than squash it, Atari's parent Warner worked out a deal in 1982 in exchange for dropping the lawsuit: GCC would design games for Atari. Atari was forced to drop its lawsuit but did so with prejudice, becoming a reluctant contractor to a company that it was trying to shut down. The now-classic games *Quantum* and *Food Fight* were a result of this deal, as were several games for Atari's 2600 system. During that time, having designed a *Pac-Man* modification kit called *Crazy Otto*, GCC approached Bally/Midway with a bluff on the possibility of letting it officially release the game. The bluff was that it had won its lawsuit with Atari – and it worked beyond its wildest expectations. Midway was actually interested in seeing *Crazy Otto* developed into a full sequel to *Pac-Man*, and so *Ms Pac-Man* was born.

Money to spend

By the end of 1983, flush with cash from its growing coin-op and consumer videogame design business, GCC took on its most ambitious project yet: designing a home videogame and computing system.

With no experience in chip, console or computer design, but full of bravado from the company's successes, several GCC employees flew out to California to take a month-long crash course in VLSI

(very large scale integration) chip design. The goal was to be able to design the custom chip needed to drive the company's new project, codenamed Spring. Jokingly named after the MIT 'Pre-Spring Fling' dance, it was intended to be a modular computer, IBM-compatible, and have graphics and sound capabilities to rival any upcoming computers or consoles. As former GCC employee Steve Golson put it in a 1994 interview, "Spring was going to be a home computer/game-playing machine to beat them all".

Shortly before the design and layout process, Atari had come out with its 'high-end' gaming system, the Atari 5200. GCC paid attention to how it played out, and in the fashion that had become typical of the company, thought that it could do better. "So we get one of these things, they sent it out to us, and we saw they screwed up. They screwed up in so many ways," Steve Golson also noted. Besides the controller issue and poor game library, most notably missing from the 5200 was 2600 backwards compatibility. It had been advertised the past June at the Consumer Electronics Show, but now was nowhere to be seen. Meanwhile the ColecoVision had come out, which offered full 2600 compatibility via an expansion peripheral. GCC needed an alternative. As Steve Golson put it: "We're the smart guys on the East Coast, and we're just going to save their butts." And GCC was going to have Atari release it whether it wanted it or not, because Warner superseded all management then at Atari.

The pitch was for a 2600-compatible system that included souped-up graphics capability by the addition of more hardware-based sprites. This evolved into a 2600-compatible system based on the advanced graphics chip being designed for Spring.

Spring's graphics system concept was based around building up scan lines and display lists rather

"THEY SCREWED UP IN SO MANY WAYS"

STEVE GOLSON ON THE ATARI 5200

"THE SPECS FOR THE MARIA GIVEN TO ATARI WERE IMPRESSIVE TO SAY THE LEAST: 320X240 RESOLUTION, A PALETTE OF 256 COLOURS WITH 25 AVAILABLE PER SCAN LINE, AND SOFTWARE-BASED SPRITE GENERATION AND COLLISION DETECTION"

EARLY SPECIFICATIONS FOR THE 7800

The machines

than bitmaps, using a process similar to Atari's 8-bit computer line and even to the 2600. For the new console, GCC thought to use double-buffered display line RAM and DMA access, something unheard of for the time in a game console. The solution for the system's 2600 compatibility was to literally include the 2600's graphics and sound chip, the TIA, on the system's main board. The inclusion of the TIA chip influenced the name of the new chip brought over from Spring – or maybe it was the past experiences of these MIT college dropouts.

Regardless, the team chose to name the chip MARIA, calling the full set on the new board TIA-MARIA after the popular Jamaican coffee liqueur. Going with Atari's now-standard approach of numbering its system names, the entire game console project itself would be called the Atari 3600.

"WE'RE THE SMART GUYS ON THE EAST COAST, AND WE'RE JUST GOING TO SAVE THEIR BUTTS"

STEVE GOLSON SPEAKS

Spec-tastic

The specs for the MARIA given to Atari were impressive to say the least: 320x240 resolution, a palette of 256 colours with 25 available per scan line, and software-based sprite generation and collision detection that could support upwards of 100 objects.

During this process, unbeknownst to GCC, the system would have its first competition with Nintendo. At the time, Nintendo had yet to release its Famicom system in Japan and was looking to find a worldwide OEM manufacturer and distributor in the guise of Atari. After a preliminary discussion between Atari's Ray Kassar and Nintendo's Minoru Arakawa and Howard Lincoln, negotiations began with Atari on 11 April when Nintendo demonstrated the prototype Famicom running an almost-complete *Donkey Kong* and *Popeye*. The offer was for Nintendo to provide 100,000 to 150,000 completely populated Famicom main boards for Atari to throw into its own consoles, all for 5,300 yen (at that time about \$20) a piece. It was certainly an attractive offer, but Nintendo at this time was a nobody in the consumer market save for a few previous *Pong* console clones.

Because of the deal that Warner made with GCC, Atari was also committed to GCC's 3600 console and had to take time to evaluate the strength and

weaknesses of both. GCC's MARIA chip design had started on 1 April and wouldn't be done until 1 July. The Atari project managers familiar with the MARIA specs felt that it was a superior system to the Famicom, however some of the Atari engineers appeared to be leaning towards the Famicom and strongly recommended going through with the deal. Atari wanted to stretch out negotiations until at least mid-July to have time to form a valid cross comparison and decide which one should form the internals of the

3600, but the fact that Nintendo had demanded a quick response on interest didn't help. Atari had no choice but to go through with committing to an interest or risk losing the console to a competitor. Over the next couple of months manufacturing and design considerations for the Atari version of the Famicom were discussed – including

an adapter to play 2600 games. Several important meetings were held as well to hash out manufacturing and supply concerns, the last of which was at the June Consumer Electronics Show in Chicago. The deal, if successfully completed, would ultimately have Atari releasing a Nintendo-based console for that 1983 Christmas season and a total of 2 million units over the contractual period.

In the meantime, the first MARIA chip sample was returned on 1 July to GCC. Unfortunately, it found that it had a problem: the chip could display a ton of sprites, but had no time in the processor's cycles to move them. Hence the design on the MARIA 2 started, and was not completed until 17 September.

Unfortunately for Nintendo, however, by July Atari's now well-known financial problems were already in full swing. In conjunction with these problems and his stock-selling misconduct, Ray Kassar was out the door during that July. Jim Morgan was brought in right away to replace Kassar, but he wanted to take two months vacation before coming to head things up by that September. Any further talks stalled and ultimately gave GCC more time to finish the revision of the MARIA. By early September, Nintendo, Warner, and Coleco had a meeting with Warner to resolve any issues over *Donkey Kong*'s licensing, and it was assumed that negotiations would continue again for Nintendo's Famicom deal.

WHY THE ATARI 7800 WAS GREAT...

IF YOU LOVED CLASSY ARCADE CONVERSIONS THEN THE 7800 WAS AN ESSENTIAL CONSOLE TO OWN. IT ALSO CONTINUES TO HAVE A THRIVING HOMEBREW SCENE

A prototype Atari 7800 developer board.

In the process of programming the 7800's version of *Robotron*.

Mario Bros. One of three titles from the old Nintendo licence.

"WHEN MORGAN CAME BACK, THE FIRST THING HE DID WAS FREEZE ALL PROJECTS FOR A MONTH"

ATARI AND NINTENDO PART WAYS

Unfortunately, when Morgan came back, the first thing he did was freeze all projects for a month. Realising that there would be no time for a Christmas release, and compounded by rumours from people leaving Atari that the company may not even have the money for the deal because of its financial problems, Nintendo was unwilling to spend any more time in limbo and decided to go it alone.

To expand or not expand

By that autumn, Morgan knew exactly what direction he wanted to take Atari in to save it and where GCC's project fit in the scheme of things. He threw Atari's full weight behind the 3600, issuing memos that it was to supersede all product development, including Atari's own ongoing console and computer projects. This was going to be Atari's flagship console and Morgan's saviour of the consumer game console division. The target was to produce a million units for the first year and an additional 3 to 4 million in the following years.

For Atari's part, it began with leveraging some of its previous design work. Atari's Barney Huang took the futuristic and sleek design profile of the 2800 and combined it with some of the high-end accoutrements of the 5200's case to form the 3600's outer shell. The 3600's controllers were taken from the 2600 Jr project, a highly cost-reduced version of Atari's flagship 2600 then in development.

The CX24 'Super Controllers', as they were then called, were designed in a similar wedge shape to the 5200's controller, including side-mounted fire buttons on both sides. A design decision intended to alleviate a common complaint of the original 2600 joysticks by left-handed players – Atari's original solution was to show how to open up the sticks and flip the PCB around to support holding it 'lefty' – GCC would then be able to utilise the extra button for more play options. Atari and GCC also worked out a solution to a problem facing both the 2600 and 5200: anyone could code and

release games for them, no licensing required, because of a previous lawsuit between Atari and Activision. This had opened up a flood of low-quality games for the console, something that Atari didn't want to see on its new system. The solution was a unique and encrypted digital signature contained on all cartridges, that when not present would automatically lock the system into 2600 mode.

GCC, meanwhile, began working on some key expandability features that it wanted the 3600 to have, some of which were also influenced by its original vision for Spring. First and foremost was the computer/keyboard expansion. Everything would centre on a unique keyboard and cartridge combination that would leverage Atari's existing computer peripherals via a built-in Atari Serial I/O (SIO) port and add 16K of RAM to the system's standard 4K.

The keyboard itself would be a fully functional keyboard comparable to those already used in Atari's XL line of computers, and would plug in to joystick port 2. GCC also designed an expansion port to further support its growth as a computer, with things like additional RAM expansions and a futuristic LaserDisc interface. Atari 3600-specific versions of Atari Basic and Atari's VideoWriter word processor were also developed to be bundled with the expansion, and VideoWriter was even expanded to allow joystick or trackball control for selecting and manipulating text. The computer expansion would give the buyer the ability to turn their console into a legitimate 8-bit computer comparable to Atari's existing low-end Atari 600XL.

GCC also realised that with the evolution to true arcade-quality graphics, other features such as high score saves would also need to be supported in the new machine. To this end, it developed a high score expansion that plugged in to the cartridge port and would store the top five scores of 65 games. Upon plugging in the expansion cartridge, the player could immediately add their own name.

The machines

If that wasn't enough, it was even smart enough to tell your difficulty settings and have separate score charts for each setting on a game.

A funny thing happened during the months leading up to the introduction of the 3600 in May of 1984: the US videogame industry's crash began hitting its crescendo. Throughout 1983, Atari's financial problems had begun not only to become a rallying cry on the lack of investor confidence across the industry, but it showed some serious changes beginning to ripple through the market. By early 1984, both game publishers and console manufacturers were regularly announcing layoffs and closures. Atari itself suffered \$539 million in losses and laid off over a third of its 10,000 employees. By January, Morgan had succeeded in eliminating 40 per cent of Atari's overhead, feeling that it was "inexcusable for a company that sells a billion dollars worth of goods not to make a profit". The overhead cuts were just the beginning, though, as Morgan sought to completely reorganise Atari's consumer division. First, he sought to improve the company's reliability image by not announcing a single product that wasn't already ready to ship, and second to cut dead weight and focus on a few profitable videogame and computer products. Morgan's new mantra for Atari was: "We're in the business of enhancing people's lives through interactive electronics." It was a view reminiscent of Atari's original 'Innovative Leisure' logo.

Casualties of war

Under this new plan, the 5200 was the first casualty, with manufacturing halted that January. Sales of the 2600 were actually up 40 per cent on original forecasts, and with the eventual release of the 2600 Jr the overhead on those would be cut drastically. With the 3600 now firmly poised to be the new flagship console, it would have to venture into choppy waters – but it would do so with a new name. The 3600 designation was considered too low for a top-of-the-line console in

its current number scheme, and it was decided to go with 7800 to denote 5200-style advanced graphics and 2600

backwards compatibility: $5200 + 2600 = 7800$. By the time of its official introduction on 21 May 1984, its title was fully expanded to the 'Atari 7800 ProSystem', and its controllers were now referred to as Proline controllers. A total of 14 titles were announced between May and June: *Ms Pac-Man*, *Pole Position II*, *Centipede*, *3D Asteroids*, *Joust*, *Dig Dug*, *Desert Falcon*, *Robotron*, *Galaga*, *Xenious*, *Food Fight*, *Ballblazer*, *Rescue On Fractulus!*, and *Track And Field*. Learning from its error of using *Super Breakout* as the pack-in title for the 5200's launch, Atari would be including *Pole Position II* as the pack-in for the summer launch. By September, it was to be built in to the 7800 itself, further adding to the console's appeal.

"A TOTAL OF 14 TITLES WERE ANNOUNCED BETWEEN MAY AND JUNE"

ATARI GETS BUSY

Unfortunately, the 7800 was met with mixed opinions, many of which questioned Atari's wisdom in releasing a new console in that climate. Atari's financial problems were producing almost daily news coverage, and it was also no secret that Warner had been looking to dump the faltering Atari on someone else. Many

news sources pondered on the likelihood of this console having any real impact as a saviour of the company. Likewise, the selection of titles was considered unflattering and already old, since many of the titles had already been released on other platforms, so they weren't as exciting to customers. Undaunted, however, Atari had a very successful test run in New York in June, but it was to be a short-lived success for the company. By 2 July it was announced that Atari's consumer division had finally been sold. The buyer was former Commodore head Jack Tramiel.

Tomcat, the F-14 fighter simulator was a decent release

GCC's MARIA chips, designed for the 7800.

The Atari 7800 had some slick arcade conversions like *Donkey Kong*.

COMMUNITY

1. Atari Museum

www.atariuseum.com

The Atari Museum, home base of the Atari Historical Society, is the premier Atari historical information and archive site. Run by noted Atari historian Curt Vendel, the site houses information and exclusive material not found anywhere else thanks to Vendel's close ties to former Atari employees. It's a superb site.

2. AtariAge

www.atariage.com

If you want to find the current fan base of the 7800, you'll find it at AtariAge's bristling online community. The de facto community site for the Atari scene, you'll also find a store that supports current 7800 homebrew authors with full packaged releases of their games.

3. The Atari 7800 Page

www.atari7800.org

Don't let the minimalist design fool you. The site is chock full of great 7800 information. Featuring reviews, technical documents, projects, photos of the original press kits and more, this site is a true gem.

4. Dan B's Atari 7800 Tech Page

www.atarihq.com/danb/a7800.shtml

Besides the previously mentioned AtariAge, if you're interested in developing your own 7800 games then this is the place to start. A legend in the classic videogame homebrew hardware and software scene, Dan Boris's page focuses on all the technical information and tools that you'll need to get started.

To say things were a mess after the purchase was an understatement. Tramiel had purchased Atari Consumer for its brand name, manufacturing, distribution network, and current line-up of products. These were going to keep his new company, Atari Corporation, afloat while he worked on his next-generation computer. However, because ownership of patents, licences and products were now split between the coin-operated division – now called Atari Games – and Warner itself, it became a nightmare of litigation over the next several years. The 7800 was the first casualty of this, with Warner actually owning the console. GCC still hadn't been paid for the MARIA chip nor the launch titles that it programmed, and Warner wanted Tramiel to pay for it. Tramiel wanted Warner to pay and felt that it should have been part of the original deal, his anger apparent when an impatient employee started trying to put pressure on him to continue with the planned release of the 7800. He responded by throwing the system off his desk, firing said employee not long after. The 7800 remained in limbo until May 1985, when Tramiel finally relented and sent GCC its payment. He then began negotiating for payment on the original launch titles, which meant he had to begin looking for someone with experience in game consoles to start up a videogames division again.

That someone turned out to be Michael Katz, then head of top computer software company Epyx. Tramiel made it clear that he wanted Katz to bring back the 2600 via the cost-reduced 2600 Jr, relaunch the 7800, and develop some more timely games for it. Katz was on the job by early November, and by December they had introduced the 2600 Jr. That January at CES Atari was publicly announcing the relaunch of the 7800,

and the original manufacturing run was out the door by the spring. Gone was the computer expansion and high score cartridge, however, but in place was a new-found sense of hope in the industry. In contrast to last time around, the 7800 was warmly

received – as were Nintendo's NES and Sega's imminent Master System, as a sign of a reviving industry. By Christmas all three were head-to-head, but Nintendo was the clear winner by 1986.

End of the line

Where once licences were split between different platforms and a company may port titles to competing consoles, the market had changed. Much development in the arcades had switched to Japan, and with Nintendo's Famicom the clear market leader there, it had a lock on the latest titles. Publishers had to get a licence with Nintendo to release for the NES, which also barred the games from being released on other consoles. While the previous Atari had been at the top of the heap, its current form found itself with few options. Katz's solution was to use his old contacts in the computer industry to get licences to what he considered hot computer titles.

The worldwide launch occurred in 1987, and the PAL version of the 7800 ended up including the promised built-in *Asteroids*. Atari and Sega both sued Nintendo over its unfair lockout practices, but both ultimately lost due to poorly presented cases. As Katz put it: "Jack was too cheap to hire decent lawyers." With the switch to 16-bit consoles by the early Nineties, Atari shut down its entire legacy product line. By the time this announcement was made in January 1992, the 7800 had sold 3,772,751 units in the US alone during its lifetime. Sadly, though, it never reached its full envisioned potential.

A special thanks to atariage.com for additional images.

ATARI 7800: PERFECT 10 GAMES

THE 7800'S CATALOGUE WASN'T EXACTLY BURSTING AT THE SEAMS, BUT IT NEVERTHELESS HAD PLENTY OF DESIRABLE TITLES ON IT, ESPECIALLY IF YOU LOVED ARCADE PORTS...

POLE POSITION II

» RELEASED: 1984 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

1 When it was first to be released as a pack-in in 1984, the Namco-authored and Atari-distributed *Pole Position II* was at its peak of popularity in the arcades and was a perfect introductory title to show off the system's capabilities against the likes of the ColecoVision's great port of *Turbo*. Exclusive to the Atari 7800, it's a faithful and fun port, save for the limitations of the 7800's 2600-based sound. Atari planned to allow its more-advanced POKEY sound chip to be included in cartridges to resolve this, but this game didn't get that treatment. Unfortunately, it suffered the same thing as the rest of the 7800's excellent arcade launch titles: by 1986 they were a bit outdated on the market.

PAC-MAN COLLECTION (HOMEBREW)

» RELEASED: 2006 » PUBLISHED BY:
BOB DECRESCENZO » CREATED BY: IN-HOUSE

2 For years the special software for generating each cartridge's encrypted validation key was thought lost. Then, in 2001, an Atari ST computer with the original key generation program was found, allowing a 7800 homebrew game community to sprout up once it made it into the public domain. *Pac-Man Collection* is a direct result of this, and is a must-have for any 7800 collector. Featuring near-perfect arcade ports of the original *Pac-Man* and *Ms Pac-Man*, arcade hacks like *Hangly Man* and *Pac-Attack*, the multiple maze *Ultra Pac-Man*, and even components like random mazes. Stunning.

JOUST

» RELEASED: 1984 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

3 The 7800 received an almost-perfect port of the early Eighties arcade favourite *Joust*. Programmed by GCC, the creator of the 7800, it pulled no stops in delivering an extremely faithful port. Even closer than the NES's 1988 release – and without that platform's addition of cheesy music – everything is there, from the actual arcade-style title screen down to the accurate sounds. An excellent play, it was yet another strong 1984 launch title that would have added to the 7800's claims of being the best, most arcade-perfect console experience on the market. What a pity then that the console had such a short lifespan.

GALAGA

» RELEASED: 1984 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

4 *Galaga* received the same treatment by GCC to produce another great arcade port and impressive launch title. Unlike the later NES port, the 7800's version has a visibly smoother motion to the sprites and really shows off the system's much-lauded multi-sprite capabilities. Beyond that, it's a trade-off between the two ports. The 7800 reproduced more of the feel and layout of the arcade version, while the NES edition changes the aspect ratio and adds a title and score area off to the side, as well as including level counter icons missing from the 7800 version. Regardless, it's an excellent arcade conversion.

“DESERT FALCON IS ONE OF THE FEW PLANNED LAUNCH TITLES THAT WASN'T A PORT. IT'S AN ORIGINAL GAME”

NOT EVERYTHING WAS AN ARCADE PORT...

DESERT FALCON

» RELEASED: 1984 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

5 *Desert Falcon* is one of the few planned launch titles that wasn't a port. It's an original game, though done in a *Zaxxon*-style scrolling isometric format. Based around an Egyptian motif, you play a falcon that wants to fly about Egypt getting treasure and firing at bad guys. With the twist of being able to land and walk, it adds elements from another isometric arcade favourite, *Congo Bongo*. You can also collect various hieroglyphics to get power-ups, which vary depending on the combinations. You can't go wrong with this game for your collection. All in all, a great early original title and a fantastic little shooter.

ALIEN BRIGADE

» RELEASED: 1990 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

6 The Atari 7800's answer to *Operation Wolf*, this game is actually hard to find because of its release late in the 7800's lifetime. It's one of only four lightgun games released for the 7800, and really a lot of fun to play. A sort of primordial plot version of Atari Games' later *Area 51* release, you play a soldier battling aliens trying to take over the bodies of your fellow soldiers. Featuring higher-end graphics and gameplay, the game is also unique in that, at completion, it actually advertises – if not commands you to play – another game released at the time: *Planet Smashers*. Definitely worth seeking out.

FOOD FIGHT

» RELEASED: 1984 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

7 An excellent port of the arcade game that follows the fantasy of any kid who has seen the infamous food scene in *Animal House*, *Food Fight* lets you fight with food – *Robotron*-style. You play Charley Chuck, who instead of saving the human race is saving an ice cream from the perils of melting. Blocking your way are chefs hell bent on keeping you from your tasty treat, with your own source of protection being food that you can throw. Just as fast as *Robotron*, it shows off the 7800's capability to faithfully reproduce arcade titles compared to the other consoles that were on the market at the time.

DARK CHAMBERS

» RELEASED: 1988 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

8 If *Dark Chambers* looks similar to Atari Games' *Gauntlet*, that's because it's based on its ancestor *Dandy* by John Palevich. Originally released in 1983 through the Atari Program Exchange (APX), *Dandy* was taken without the author's consent and morphed into *Gauntlet*. Palevich soon negotiated the rights to *Dandy* with Atari and continued its development on his own, but was never given credit in *Gauntlet*. However, the *Dandy* update *Dark Chambers* appeared on the 7800 and he was finally given full credit. And it's just as fun to play as any of the previous versions! If you don't believe us hunt down a copy and find out for yourself.

CENTIPEDE

» RELEASED: 1984 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

9 What can we say about *Centipede* that hasn't already been said? It's a classic arcade shooter that one would expect to see on an Atari console, and once again GCC did a near-perfect port. About the only thing lacking is, of course, a 7800 trackball, but the flawless motion and gameplay more than make up for the omission. This is the type of game that you think of when you think 'lots of sprites', and the 7800 handles them easily. Even the sounds are spot-on to the original arcade version. A superb launch title for 1984, it's also one of the few timeless early 7800 games that still held up during its relaunch a couple of years later.

SPACE INVADERS (HOMEBREW)

» RELEASED: 2008 » PUBLISHED BY: BOB DECRESSENZO » CREATED BY: IN-HOUSE

10 Unfortunately, if you wanted to play *Space Invaders* on your 7800 you were limited to the 2600 version. By 1986, Taito was already under lockout from Nintendo, whose Famicom got an updated port. While the 2600 version is respectable and still fun to play, it hardly takes advantage of the 7800's more advanced capabilities. That situation was solved by homebrew author Bob DeCrescenzo, who also brought you the *Pac-Man* Collection. *Space Invaders* for the 7800 gives you an arcade-perfect port, right down to the overlay colouring schemes of the original.

ATARI 7800

AND THE REST...

Atari's 7800 was certainly short-lived, but it did manage to feature a solid array of arcade conversions. How many of the following titles have you played?

- 1 F-18 Hornet
- 2 Karateka
- 3 Motor Psycho
- 4 Crossbow
- 5 Pit Fighter
- 6 Basketbrawl
- 7 Rampage
- 8 Dark Chambers
- 9 Asteroids
- 10 Kung Fu Master
- 11 Fatal Run
- 12 Combat 1990
- 13 Mat Mania Challenge
- 14 Ninja Golf
- 15 Dig Dug
- 16 Joust
- 17 Donkey Kong
- 18 Super Huey
- 19 Fight Night
- 20 Impossible Mission
- 21 Pole Position II
- 22 Summer Games
- 23 Meltdown
- 24 Tower Toppler
- 25 GATO
- 26 Midnight Mutants
- 27 Choplifter
- 28 Desert Falcon
- 29 Planet Smashers
- 30 Sentinel
- 31 Klax
- 32 Robotron: 2084
- 33 Food Fight
- 34 Scrapyard Dog
- 35 Jinks
- 36 Ballblazer
- 37 Double Dragon
- 38 Ms Pac-Man
- 39 Galaga
- 40 Xenophobe
- 41 Donkey Kong Jr
- 42 Crack'd
- 43 Mean 18 Ultimate Golf
- 44 Centipede
- 45 Ace of Aces
- 46 Commando
- 47 Mario Bros
- 48 Rescue on Fractalus!
- 49 Hat Trick
- 50 Missing In Action
- 51 Alien Brigade
- 52 Barnyard Blaster
- 53 Winter Games
- 54 Ikari Warriors
- 55 Xevious
- 56 Waterski

ATARI ST

IT WAS THE MACHINE THAT SINGLE-HANDEDLY REVIVED THE FORTUNES OF AN INDUSTRY VETERAN. RETRO GAMER SPEAKS TO THE MAN RESPONSIBLE FOR MASTERMINDING THE GREATEST COMEBACK SINCE LAZARUS

Following the videogame crash of the early-Eighties, Atari was in horrifying shape. The company's failure to successfully build on the triumph of its popular 2600 console (a machine languishing in obsolescence by this point), coupled with a generally poor quality of software available had triggered a catastrophic meltdown that very nearly destroyed the entire videogame industry. After the dust had settled, Atari's parent corporation Time Warner had incurred a cataclysmic \$500 million loss and was predictably keen to offload its flagging games division. What occurred next has gone down in videogame folklore as one of the most startling turnarounds in the history of the medium.

Trading Places

Ironically, the man behind the product that would resurrect the ailing Atari brand had previously been instrumental in sullyng the fortunes of the very company. Shiraz Shivji worked at rival Commodore during the early-Eighties and helped build the C64 – the home computer that stole away vital market share from Atari's 400 and 800 range, as well as its 2600 console. "I became interested in electronics from my early childhood in Tanzania and my education in the UK," says Shiraz, when asked about how he became entangled in the fabric of Atari's history. "I attended the University of Southampton and obtained a First-Class Honours degree and then moved to Stanford University in the US to pursue a PhD in electronics. I was granted a master's and passed the qualifying exam but left before obtaining my degree as I was running out of funds. I started working in Silicon Valley and obtained experience in hardware and software." By 1984 Shiraz had risen to the role of director of engineering at Commodore and it was at this point that fate intervened.

Although Commodore was undoubtedly causing Atari some serious headaches, things weren't exactly harmonious in the boardroom. "Jack Tramiel was president and CEO of Commodore and Irving Gould was the chairman," explains Shiraz. "Irving was the largest shareholder and Jack was the second largest. In January 1984 there was a showdown between the two of them over the role of Jack's sons at Commodore." Polish-born Tramiel had founded the company in the Fifties after enduring a particularly difficult early life (he was interned in Auschwitz concentration camp for five years during World War II), so his insistence on 'keeping it in the family' is understandable. However, Irving refused to budge and this forced Tramiel's hand. He called a board meeting and tendered his resignation. "I was tremendously disappointed and shocked at this decision," remembers Shiraz.

However, it wasn't long before the two men were reunited. "I soon met with Jack and discussed the possibility of joining him if he was to start a personal

computer company," recalls Shiraz. "There were a number of senior execs at Commodore with experience in finance, manufacturing, design, engineering, marketing and sales that felt the same way, so I told Jack he could count on a core team to start a company. At this time Warner Communications was thinking of selling or disposing of Atari as it was losing a lot of money. Jack made an offer for the company by injecting \$30 million – \$25m from himself and \$5m from associates, such as myself. Eventually the deal was struck and that is how I came to be the vice president of advanced development at Atari."

Rising to the challenge

Having switched sides in dramatic fashion, Tramiel had a new company to command in the shape of Atari Incorporated. He now needed a product that would get the firm back on its feet. Thankfully Shiraz and his team already had ideas forming. "The core team of engineers and developers were thinking of the next personal computer," Shiraz says. "The work on the ST didn't really start until Atari was actually purchased, but the main ideas of using a 32-bit processor as well as support for music and graphics were already important for us."

Shiraz duly started work on the new project codenamed 'Rock Bottom Price', or 'RBP' for short – an indication of Tramiel's desire to produce a cheap yet powerful home computer. "We moved everyone into the Atari facilities on Borregas Avenue in Sunnyvale in

"MUSIC AND GRAPHICS WERE IMPORTANT TO US"

WHY THE ATARI ST WAS GREAT...

ATARI WOULD STILL BE REMEMBERED SOLELY AS THE COMPANY THAT FLUSHED THE ENTIRE VIDEOGAME INDUSTRY DOWN THE TOILET IN THE EARLY-EIGHTIES WERE IT NOT FOR THE SAVIOUR THAT WAS THE ST. IT MAY HAVE LOST THE WAR TO THE COMMODORE AMIGA, BUT THIS LEGENDARY MACHINE WAS THE FIRST TRUE 16-BIT HOME COMPUTER AND PLAYED HOST TO SUCH SEMINAL GAMES AS DUNGEON MASTER AND STARGLIDER. IT WAS ALSO BRILLIANT FOR BEDROOM TUNESMITHS THANKS TO ITS BUILT-IN MIDI SUPPORT.

INSTANT EXPERT

Atari ST

- Recording artists that have used the ST include Fatboy Slim, Mike Oldfield, UK one-hit wonder White Town and French knob-twiddler Jean Michel Jarre.

- The machine was amazingly popular in Germany, where it was used predominantly for desktop publishing and CAD.

- The ST was the first home computer to feature built-in MIDI ports.

- Released in 1986, the 1040 ST variant was the first personal computer to include 1 MB of RAM.

- When the price dropped to \$999 it famously became the first computer to break the \$1,000/megabyte price barrier.

- One early tagline for Atari's ST range was 'Power without the price'.

- Jack Tramiel included the Hebrew alphabet with ST's ROM character set to respectfully acknowledge his Jewish heritage.

"WE MOVED EVERYONE INTO
ATARI FACILITIES ON BORREGAS
AVENUE IN SUNNYVALE
IN JULY 1984"

SHIRAZ SHIVJI

The machines

July 1984," says Shiraz, who had to dig into his own pockets to ensure development went smoothly. "I paid for airline tickets and hotel bills for my hardware team using my own personal credit cards and was not paid until much later. I think the real development began in August; we didn't usually get home until 11pm some nights, and sometimes it was well after midnight."

This punishing schedule was made even more demanding because Shiraz knew exactly what would happen if he failed to deliver the goods on time. "If we did not come through we would have had to close shop," he states, matter-of-factly. "You can imagine I really felt the very heavy burden of responsibility. We had no choice but to deliver a product that was superior in terms of performance and price." Amazingly, this intense pressure seemed to bring out the best in the team. "I felt very confident and comfortable that I and the team were up to the task," states Shiraz. "After all, I had a core hardware team of four engineers from Commodore that had worked for me in the past so I knew what they could do. We integrated with people from Atari and had a very small but efficient team that worked very hard to get the hardware done in record time. Somehow, although there was much pressure on us, I did not have any sleepless nights. This is because of the trust I had in the team."

The engineers at Atari originally envisaged the machine as a 'true' 32-bit computer, but eventually compromised and settled for a 32-bit processor that communicated through a 16-bit external bus (the abbreviation 'ST' actually stands for '16/32'). "We had a meeting with the CEO of National Semiconductor, who was anxious for us to use their 32-bit NS3200 processor," remembers Shiraz. "It turned out that even though the Motorola 68000 was a quasi-32-bit chip, the performance turned out to be as good, if not better than the National Semiconductor's true 32-bit chip. Motorola had a number of parts that they could not sell as one of the parameters did not fully meet their specification, but we found that this particular parameter could be relaxed in our design and so we could use these parts that would have to be thrown away, saving both us and Motorola several million dollars." Amazingly, despite these cost-cutting measures, the ST was still able to outperform more expensive rivals. "Our design was so optimised for performance and cost that you could

emulate the Apple Macintosh – if you had the Apple ROMs – and an application would run faster on the Atari ST," reveals a justifiably proud Shiraz.

As the project neared completion, Shiraz and his team started to realise just how amazing their achievement was. They had taken the ST from rough concept to final product in less than half a year, and when 85 per cent complete ST machines were shown at the CES show in 1985, it amazed the industry. "I was very proud that the team had accomplished so much in a short period of time," says Shiraz. When the machine officially launched in May, it marked the dawn of a resurgence for the previously ailing company and it speaks volumes for the popularity of the ST range that when Tramiel took Atari public in November, stock was selling for nearly triple its original price just a few months later. The ST had saved Atari from the scrapheap, and all in less than half a year.

Business or pleasure?

It may come as a shock to learn that the man behind the ST isn't much of a gamer. "I'm not into games myself but I am quite aware of what needs to be done in the hardware to create good games," says Shiraz. "With the ST, the processor/memory bandwidth is highly optimised, leading to very fast graphical interactions. I think the entertainment software for the ST was reasonably good, but first and foremost this was going to be a consumer machine." Despite this obvious focus on business, the ST played host to some truly groundbreaking pieces of software and received sterling support from the likes of Bullfrog (*Populous*), Spectrum HoloByte (*Falcon*), FTL (*Dungeon Master*), Realtime Games (*Carrier Command*), Argonaut (*Starglider*) and David Braben (*Virus*).

The Atari ST may have been great for playing games on but it also proved to be a massive hit with musical types, too, who were keen to play around with the tech and push it as far as possible. "Right from the start we were interested in providing good musical capability," explains Shiraz. "Since we felt that the Yamaha chip in the ST was not as strong as we would have liked, we thought that we should put in an interface for external music access. We found that we could do it rather inexpensively using a Motorola serial chip and a connector for the MIDI-port. The total cost for this was 75 cents. The biggest problem was finding the space

Borregas Avenue, Sunnyvale, California – the site of Atari's HQ during the ST years.

The ST's TOS (Tramiel Operating System) in all its lurid green glory.

COMMUNITY

ATARI.ORG

www.atari.org

A bustling and active community, Atari.org not only contains a wealth of information but also hosts several other sub-sites, run by Atari fanatics. It doesn't look like much but is a great resource and easy to navigate.

Atari Legend

www.atarilegend.com

Solely focused on keeping the memory of the ST alive, Atari Legend doesn't get updated as often as we'd like but still contains a lot of interesting content, including reviews, interviews and demos. It's well worth taking a look at.

Little Green Desktop

www.lgd.fatal-design.com

The name of this site alludes to the distinctive tint of the Atari TOS operating system; the design may hurt your eyes but the content is superb. As well as running a spotlight on different games, it also carries old issues of ST Format.

The ST's distinctive mouse was certainly eye-catching, but using it for long periods proved uncomfortable.

for connectors in the back. Musicians found it a great and inexpensive MIDI instrument."

Sadly, it didn't take very long for Commodore's brand new Amiga to overshadow the ST and as the Eighties drew to a close Atari's once impressive machine was starting to trail its opponent. US sales dropped off dramatically, but in Europe the machine remained a healthy success. Shiraz has his own theory on this disparity: "The reason is very simple – distribution channels. Atari did not have any distribution channels to speak of in the US. In Europe, we had a great cadre of ex-Commodore people and dealers that we could use."

Ironically, considering they were locked in battle for much of their life spans, the Atari and Amiga are intrinsically linked. "Jay Miner was at Atari in the old days and was involved in the design of their products," explains Shiraz. "He left Atari to design the Amiga. Atari had funded some of this effort and had an option to buy the Amiga, and when we took over in July 1984

the first order of business was to decide what to do with this option. The problem was that the Amiga was not quite ready and would need a lot of money to fully acquire. We decided to pass, but this put enormous pressure on our own development team. Commodore, on the other hand, did not have an internally developed 32-bit graphics-oriented machine or the confidence to develop anything internally, so they ended up buying the Amiga for between \$25-\$30 million and spent a further \$20 million or so on it, releasing it a little after the launch of the ST. The roles were reversed – the Atari ST has a Commodore pedigree, while the Commodore Amiga has an Atari pedigree!"

The final push

To claw back some of the market, Atari sanctioned the release of an updated machine, dubbed the STE (with the E standing for Enhanced). Shiraz's involvement was minimal: "I was on my way out of Atari at that time. I left in 1989." Other versions of the computer were also put into production, including the ambitious Atari TT and Falcon, but neither of these met with any degree of success. "The problem was that Motorola had lost the processor battle," comments Shiraz. "The TT was based on the Motorola 68030, a successor to the 68000. This processor was clearly inferior to the 386 and 486 from Intel. There was no way Atari could compete with Motorola processors." In 1993, Atari pulled the plug on its range of home computers in order to focus its attention on the ill-fated Jaguar console and sank once again into a period of recession.

Having created one of the quintessential home computer platforms of the past 20 years, what memories does Shiraz hold dearest after all this time? "The teamwork was outstanding," he replies. "Even today most of the members of the team look very fondly at that time as the best years of their lives. The total hardware development was done in the space of five months. I have not seen such an accelerated development for such a complex project in that amount of time."

YOU'RE A GEM

As the hardware neared completion Shiraz's team naturally began to look for possible operating systems to use with the machine.

"The hardware was fairly easy for us to do and we beat the Amiga team to the punch although they had started at least two years earlier," says Shiraz. "The problem we both had was how to get a modern operating system." Early on in the development of the ST, Atari was contacted by Microsoft with the suggestion that the company port Windows to its new home computer. This idea was rejected as Windows was still two years away from being finished, and given the pressing need to get the ST in shops, Atari simply could not afford to waste time. Casting aside the expensive alternative of coding an operating system in-house, Atari got in touch with Digital Research – creator of the GEM system. "Commodore's Amiga team solved the OS problem by going to the UK to get a sophisticated multi-tasking system, but for us we really had no choice but to go with Digital Research," explains Shiraz.

"We came up with a deal with Gary Kildall, president and CEO of Digital Research, to licence and use GEM and to use some of his engineers to help port it on the Atari ST. We sent a team of engineers to work in Monterrey where Digital Research was located." It was a task of Herculean proportions, as bugs were still being ironed out while the porting was taking place, luckily the team finished their tough task.

VERSIONS

Atari STacy (1987)

The Atari STacy was essentially a portable ST for the more mobile user. This unwieldy beast ran off 12 'C' cell batteries and would grant a measly 15 minutes of use before exhausting its power supply. Ironically, it could imitate the more expensive Apple Mac Portable via emulation, and was even faster – proof that the ST's power was not to be underestimated.

Atari STE (1989)

The ST Enhanced was pretty much how it sounded – a slightly improved version of the original machine. It featured a larger colour palette, improved sound capabilities and a new graphics co-processor, but sadly few games were produced to take advantage of this new power, and the machine proved too little, too late.

ST Book (1990)

Amazingly, the STacy wasn't a complete disaster and this led Atari to produce a successor – the ST Book. Slimmer and more portable than its forbear, the ST Book was less power-hungry because it lacked a backlit display – which naturally made it hard to use in dim light.

Atari Falcon (1992)

The final entry in Atari's home computer range, the Falcon was so hurriedly rushed to market that the casing wasn't ready for launch and so it used the 1040 ST exterior instead. Discontinued after a year, the Falcon remains a popular platform for those interested in hardware modification.

ATARI ST: PERFECT 10 GAMES

ALTHOUGH THE ATARI ST WOULD OFTEN LOSE OUT TO THE MORE POWERFUL AMIGA, THERE WERE STILL PLENTY OF FANTASTIC GAMES AVAILABLE FOR IT. WE'VE GONE THROUGH THE ARCHIVES AND PICKED OUT OUR 10 FAVOURITES

OIDS

» RELEASED: 1987 » PUBLISHED BY: FTL GAMES
» CREATED BY: DAN HEWITT

1 We're willing to put our neck on the line here and say that this *Thrust*-clone by Dan Hewitt is probably the best game of its type. Piloting a triangular V-wing fighter, your job was to travel to a variety of hostile planets to liberate the titular Oids – the planets' imprisoned android slaves. However, working against you was the strong gravitational pull of the planet's surface, which attempted to drag you into its sharp, mountainous maws. On top of this you also had to deal with hordes of rocket-spewing enemy spacecraft and your ship's rapidly depleting fuel gauge. The icing on the cake came in the form of a nifty level editor that allowed you to effortlessly mock up your own planets and galaxies to play through.

XENON 2: MEGABLAST

» RELEASED: 1989 » PUBLISHED BY: IMAGEWORKS
» CREATED BY: MARTIN DAY

2 The Bitmap Brothers' sequel to its seminal shoot-'em-up franchise was entrenched in trippy colours, eye-blistering visuals and a punchy soundtrack by acid-house musician Tim Simenon (aka Bomb The Bass). Playing slightly differently to its predecessor, however, *Xenon 2: Megablast* retained the vertical shooter ideals of the original, but would drop the vehicle-shifting and arena-setting for an unusual underwater backdrop, plus a unique vertical-scrolling perspective that allowed players to pull the camera backwards. While *Xenon 2: Megablast* feels somewhat sedate when compared to its Eastern contemporaries, it remains a solid blaster.

MIDWINTER

» RELEASED: 1989 » PUBLISHED BY: RAINBIRD
» CREATED BY: MIKE SINGLETON

3 Many people are put off by *Midwinter's* complexity, but those who invest time into the game are greatly rewarded. Set in *Midwinter*, a sprawling island forged inside harsh snowy wastelands, the player must try to stop a maniacal general from overthrowing the snowy islet. Playing the role of a police officer, your mission is to explore the island, evade enemy troops, and enlist the support of the islanders. Played out through a first-person perspective, *Midwinter's* harsh and bitter environment won't be to everyone's tastes, but it's definitely a place that every ST owner and strategy fan should take time to visit.

TIME BANDIT

» RELEASED: 1986 » PUBLISHED BY: MICRODEAL
» CREATED BY: BILL DUNLEVY AND HARRY LAFNEAR

4 If you're after a game that fuses elements of *Pac-Man*, *Bomberman*, *Gauntlet*, time travel and text adventures then you should track down *Time Bandit*. Debuting on the Tandy TRS-80 before being ported to the Amiga and ST, its authors, Bill Dunlevy and Harry Lafnear, set about refining it brilliantly with the extra power. As a treasure hunter, your mission was to travel to 16 distinct worlds to collect valuable artefacts. One of its neat touches is that many of the levels pay homage to classic arcade games. 'Shadowland', for example, is clearly a send-up of Namco's pill-chomping maze classic, *Pac-Man*.

"A MIX OF TRON AND BLADE RUNNER, WITH SOME GIGER-STYLE IMAGERY AND JEAN MICHEL JARRE TUNES THROWN IN"

YOU REALLY NEED TO PLAY CAPTAIN BLOOD

NO SECOND PRIZE

» RELEASED: 1992 » PUBLISHED BY: THALION
» CREATED BY: CHRIS JUNGEN

5 *No Second Prize* was a slick 3D motorbike racer that was clearly a few hundred CCs ahead of its contemporaries. The game featured six distinct drivers, 20 well-designed and diverse tracks and some staggeringly smooth scrolling. Bolstering its lavishness were its neat vector 3D graphics, a finely tuned difficulty curve and a sublime electro-rock soundtrack by one of the most established composers in the ST scene – oh and you could edit your own replays after each race, too (it was one of the earliest games to let you do that). If you're looking for a great alternative to the excellent *Stunt Car Racer* then seek this out.

LETHAL XCESS

» RELEASED: 1991 » PUBLISHED BY: ECLIPSE SOFTWARE
» CREATED BY: CLAUS FREIN

6 Yet another ST classic, *Lethal Xcess* is a masterpiece on the ST that pushes its technical boundaries to the limits. While there exist far better examples of the top-down vertical shooter (we've got a making-of one of them in this issue), *Lethal Xcess*'s greedy looking sprites, and frenetic kill-everything-that-moves gameplay, struck a chord with ST owners. A sequel to another underappreciated top-down vertical shooter called *Wings Of Death*, *Lethal Xcess* boasted a neat two-player mode and a novel power-up system that allowed you to power up your power-ups. A highly inventive shoot-'em-up that you really should play.

CAPTAIN BLOOD

» RELEASED: 1988 » PUBLISHED BY: MINDSCAPE
» CREATED BY: PHILIPPE ULRICH

7 The prospect of getting sucked into your own videogame is one that few programmers – other than the team behind *Rumble Roses* – would relish, but this is the dilemma facing Captain Blood, and that's only the start of his problems. After being zapped inside his own binary, Blood discovers he's been cloned and each of his doppelgangers are leeching off his life-mojo. It's up to you to travel the galaxy, decipher peculiar alien text and track your targets before it's too late. A mix of *Tron* and *Blade Runner*, with some Giger-style imagery and Jean Michel Jarre tunes thrown in, *Captain Blood* is a gloomy but atmospheric RPG classic.

BLOOD MONEY

» RELEASED: 1989 » PUBLISHED BY: PSYGNOSIS
» CREATED BY: DAVID JONES

8 We were toying with putting *R-Type* on this list, but felt David Jones' *Blood Money* was the marginally better side-scrolling blaster. It's smoother, looks amazing and has an innovative gameplay mechanic where certain enemies would rather pilfer your pockets than cause you damage. Anyway, sticking with the *R-Type* comparisons, *Blood Money* can best be described as Irem's game but set underwater. Controlling a chubby looking red submarine, your mission was simple: avoid hitting the walls, shoot anything that moves, collect the coins and kit out your vessel with all manner of power-ups. *Blood Money* is simple, sublime fun.

STARGLIDER

» RELEASED: 1986 » PUBLISHED BY: ARGONAUT SOFTWARE
» CREATED BY: JEZ SAN

9 One of Argonaut Software's earliest games, *Starglider* clearly has the company's 3D vector stamp all over it. Your mission was to traverse the planet of Novenia and blast away any and all alien craft from inside your AGAV or Airborne Ground Attack Vehicle. Inspired by Jez San's love of Atari's brilliant *Star Wars* coin-op, *Starglider* became a high-profile release and a big hit after it appeared in cut-down-for-telly-competition form on popular children's television show *Get Fresh*. Packed with a 64-page novella, which was scribed by fiction author James Follett, *Starglider* was an engaging space blaster that remains great fun today.

DUNGEON MASTER

» RELEASED: 1987 » PUBLISHED BY: FTL GAMES
» CREATED BY: DENNIS WALKER, DOUG BELL

10 A sprawling and flawlessly designed first-person RPG that oozed atmosphere, bagged itself a trove of awards and went on to influence a swathe of classic RPG brilliance, including the likes of *Lands Of Lore* and *Eye Of The Beholder*. The game is a brilliant portent of 3D labyrinthine levels, wonderfully imaginative creature designs and accessible RPG elements. It's brilliantly intuitive mouse-controlled interface, glorious colourful visuals, fantastic strident score and real-time combat, helped to make it a huge success around the world. The game has since spawned four sequels, including the Saturn exclusive *Dungeon Master Nexus*.

ATARI ST AND THE REST...

Often seen as a poor man's Amiga, the Atari ST nevertheless had a fantastic assortment of games available for it. Here then is a selection of some of its very best and worst titles.

- 1 B.A.T.
- 2 Questron
- 3 Harley-Davidson
- 4 Technocop
- 5 Advanced Ski Simulator
- 6 Weird Dreams
- 7 Cabal
- 8 Operation Wolf
- 9 Zarch
- 10 Encounter
- 11 Black Lamp
- 12 Overlander
- 13 Lancelot
- 14 F29 Retaliator
- 15 R-Type
- 16 Ultima VI: The False Prophet
- 17 Armalyte
- 18 Nebulus
- 19 Goal!
- 20 Yolanda
- 21 The Adventures of Robin Hood
- 22 TinTin on the Moon

AND ADDICTIVE GAMES, LYNX WAS
AHEAD OF ITS TIME. AND ALTHOUGH IT
HAD POOR BATTERY LIFE, TITLES SUCH
AS CHIP'S CHALLENGE, CALIFORNIA
GAMES AND KLAX WERE WORTH
CHARGING THEM UP FOR

ATARI LYNX

A FULL-COLOUR SCREEN, 16-BIT TECHNOLOGY AND ADDICTIVE GAMES. EPYX THOUGHT NINTENDO WOULD JUMP AT THE CHANCE OF SNAPPING UP 'THE HANDY', ITS FLEDGLING HANDHELD CONSOLE. BUT AS DAVID CROOKES REVEALS, Epyx WAS IN FOR A BIT OF SHOCK...

"Grab your suit and passport." Dave Needle looks up. It's three o'clock in the afternoon and standing in his office is David Morse, the CEO of Epyx, with an urgent look on his face. "I need you to join me on a flight to Japan. The plane leaves in three hours." Needle glances at his watch and then dashes home. Uncertain of exactly what is happening, he nevertheless grabs his best suit, takes his passport from his drawer and heads to San Francisco airport.

The trip

Morse and Epyx board member Joe Horowitz are waiting for him. They board the plane, making their way to the upper deck of the half-empty jumbo jet heading for the Land of the Rising Sun. As the plane takes off, Morse begins to explain what's happening. A private meeting has been set up with Nintendo's Shigeru Miyamoto, with one goal: selling the 'Handy'. The handheld console Needle and colleague RJ Mical have been working on needs to be sold. Epyx doesn't have the available finances to take the product to market and it might just be possible that Nintendo can be persuaded to buy it and sell it as one of its own products.

As they snack on shrimp, cheese and caviar, Needle begins to feel uneasy. Something isn't quite right. 20 years on, he recalls exactly what he was thinking, "We didn't have a planned presentation", he says. "I felt it wasn't the sort of pitch that you made off the cuff. It would take a lot of work to present it properly. It was Japan. I'd dealt with this sort of stuff before, and if we were going to be on their playing field we must play by their rules." Needle's instinct was right. Horowitz was convinced that they would be able to force their way into Nintendo's pocket. And while Morse remained

sceptical, he was powerless to call a halt to proceedings. The flight to Japan was to prove lengthy.

The meeting had been set up by Henk Rogers, a Dutch-born entrepreneur known for successfully winning the handheld and console licences of *Tetris* from the former Soviet Ministry of Software and Hardware. Rogers had snatched the rights from under the nose of The Mirror chief Robert Maxwell. At this moment in time he was helping Epyx to make its important pitch to Nintendo.

INSTANT EXPERT

- The Lynx was the world's first colour handheld console and was initially sold with California Games.
- It came packaged with a case, a ComLynx cable and AC adapter (later replaced by six rapidly depleting AA batteries).
- The handheld was developed by Epyx using the talents of Dave Needle and RJ Mical and attracted Atari's interest even though both had been members of the Amiga design team.
- Needle and Mical had based the Lynx developer's kit around an Amiga.
- With a 3.5-inch screen, the Lynx visually packed a punch. The screen could even be flipped to allow for left or right-handed play.
- There was a two-inch speaker (the Lynx II had two speakers) and an eight-directional joystick.
- The console had two basic chips and they each had a name too: Mikey and Suzy. Awww. Both were 16-bit custom CMOS chips running at 16MHz and were run via an 8-bit CPU.

The machines

These pictures show the actual working emulation of the Handy used during prototype stages.

What Epyx hadn't predicted, however, was the aggressive pitch put forward by Horowitz. "We were in the presence of Nintendo," Needle recalls. "Joe tried a hard sell, and as he spoke, David and I felt our faces turn red. It carried on for some time, and before long we were ordered out of the building. It was just too strong. Yet it didn't stop Joe – he got even louder. Luckily, Henk intervened and put an end to the pitch. Nintendo then allowed us to remain for a moment so the reps could show us something."

Enter Game Boy

A pair of small boxes were brought into the room. They were placed upon a table and opened in front of us. Needle, Morse and Horowitz glanced across at each other nervously, uncertain of what was about to be revealed. Inside each box was a set of handheld videogame consoles. There was a communications cable that enabled them to be played together, and it was ready to go to market immediately. "We were the first non-Nintendo people to learn of the existence of the Nintendo Game Boy," Needle says, recoiling even at the memory. "We were crushed. Joe was infuriated. The Nintendo boss left the room and we just sat there, wondering what to do next."

OTHER VERSIONS

LYNX II

One of the hallmarks of the Atari Lynx (other than poor battery power and the ability to flip the screen upside down so that left-handers could play) was its size. It was enormous. So when Atari decided that competition from the more compact Game Boy meant that the Lynx needed a revamp, one of the first things it did was cut it down to size.

But that's not all. As well as making the rubber hand-gripped Lynx II smaller, the battery power was enhanced, it added stereo sound and had a power-saving pause option that turned off the screen. It was also cheaper, retailing at £99, although it didn't come with any accessories or a game. "By removing the games cartridge, we have brought the price down below the psychological £100 price point," Atari's Peter Walker said at the time.

The Handy was an ambitious project. A full-colour, 16-bit handheld games console that was so far ahead of its time, it took 12 years before anyone bettered it. It was devised by Morse, Needle and Mical, working with a large, talented team at Epyx and had been drawn up on napkins in August 1986 while the trio enjoyed a meal in a plush little cafe in the affluent Foster City, California. They were already heavily involved in the computer industry: Morse had been the mastermind of the Amiga home computer, and RJ and Needle were members of that team and had played a large part in its creation. It was time to start something new.

"We were really intrigued by the idea of creating a handheld console," says Needle. "We knew it was possible and so we cracked on with it straight away." As for the 'Handy' name: "I can't remember how we got the name," says Mical. "Everyone was popping up with clever stuff in those days. They were heady times filled with promise and productivity. Man, we jammed."

Before long, Epyx had assembled a team large enough to look after the software, hardware, industrial design and audio facilities of the console. Morse, who had been installed as Epyx's CEO after founder Jim Connelley decided to leave, put the entire process together and led the project from the start.

The first prototype of the Epyx's handheld had a black-and-white screen. "But it didn't have the 'zing' we thought it ought to have," says Needle. "Many people in the group wanted us to stick to black and white. They said the cost, battery life, weight and viewability effects of changing to colour would hurt the product." Yet Needle and Mical stuck to their guns and the project shifted to colour – 4,096 of them, the same number as the Amiga. "It was a continuation but we weren't creating a handheld Amiga," says Mical. "The leading-edge display was the most expensive component, so the colour choice was one of economy." Needle adds: "If the low-cost glass and drivers would have supported a million colours, I would have done it." It was decided that the 65C02 chip would be used since it outperformed the rest and the Handy became the first gaming console with hardware support for sprite zooming and distortion. It allowed for fast pseudo three-dimensional games, making life easy for programmers.

"Many engineers knew it and would happily program in assembly for it," Mical says. "There was a large existing body of code because the 65C02 was in popular systems such as the Commodore 64. Best of all, though, it was cheap and fast. Needle explains: "I invented the technique for planar expansion/shrinking capability for an arcade game I had done several years before. It was a space alien/earth attack game with a 3D rotating planet, 3D giant robots, ground-tracking shadows and was pretty cool. We also came up with a way of avoiding filled polygons by taking a triangle and sizing it as you wished. It's not as great as a real polygon, but this way the surfaces had full texture all the time with absolutely no performance penalty."

While work progressed on the hardware, Epyx continued to produce videogames such as *Chip's Challenge* and a Handy department was created. At one point it was sealed off from the rest of the building for security purposes. It was decided that cartridges would be used for the games. Although there had been reports that games were going to be loaded from tape, Mical says there was no truth in them. "We did think about hard disk a little..."

ANTI RED-EYE

Although RJ Mical was happy with the Lynx, saying, "We got exactly what we set out to create", one feature he would have liked was infrared. Named RedEye, the infrared capability was demonstrated in the lab but it was decided to go for the ComLynx instead.

"RedEye would have been cool," says Mical. "You would need to maintain 'line of sight' between players, though, and that could have been a problem. We dreaded the feared 'crossing legs' boy who would cross his legs and block his unit from the network."

Yet by the time the machine was ready, Epyx had hit financial problems. The Commodore 64 market, which was Epyx's core audience, wasn't pulling in the cash any more. It had also invested in VCR games but with little success. Staff levels were falling from around two hundred to just 20 employees. If the Handy was ever going to be released it would need the backing of another company. Hence, the ill-fated journey that led the group to knock at the hallowed doors of Nintendo.

When that fell through, Horowitz decided to approach Atari, and made a phone call to Jack Tramiel, the chief executive at that time. Atari had already tried its hand at producing a portable machine, the Atari 2200, which

The Lynx's conversion of *RoadBlasters* was absolutely stunning and proved just what was possible on Atari's handheld when in skilled hands.

Atari's Lynx catalogue showed off the large number of games.

COMMUNITY

The Atari Times

www.ataritimes.com

Since 1996, this site has been an essential Atari resource and is packed with Lynx features, including reviews of both commercial and homebrew games. With reviews updated as and when new games arrive, the site is a brilliant place to start when reading up on the latest for the handheld.

Atari Age

www.atariage.com

If you are trying to track down and play some games for your Lynx, Atari Age has not only a great many intricate details (from the three different cartridge styles and company profiles to tips and cheats), it also has an excellent rarity guide, listing every Lynx game created. Not to mention its bustling forum.

Songbird Productions

http://songbird-productions.com

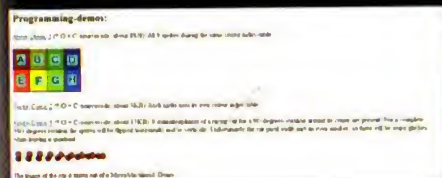

When the Atari Lynx died a commercial death, its fan base took over in much the same way as with the majority of retro machines. Songbird Productions was set up in 1999 to produce games such as Loopz and Total Carnage for the Lynx and Jaguar. You can also browse through its catalogue via the website.

Matthias Domin's Atari Lynx page

www.mdgames.de/lynx_eng.htm

If you're pretty nifty in the coding department, then Matthias Domin has put together a fine selection of tools that will be of great assistance when taking the initial steps and using your talents to create new Lynx content. There are also some great little games on there to try out.

was based on the Atari 2600. But it just couldn't seem to get it right. As time went on, however, Atari began to ignore the growing stature of consoles and had become heavily involved in a business war against Commodore. Tramiel finally realised the worth of consoles when the NES stormed onto the market – so he was rather taken by the Handy, believing it to be a great way back to console dominance.

Soon after Horowitz approached Atari, Jack's son, Sam, went to Epyx. He was greeted by Joe and showed around. They then sat in an office and discussed some terms. It was eventually decided that Atari would manufacture and market the handheld console and Epyx would create the videogames, getting paid by Atari for each title that was produced. However, in the contract was a clause that issued Epyx a deadline. For example, the company had 60 days to fix any bugs that Atari said needed to be rectified. Needle says: "Atari routinely waited until the end of the Epyx time period to comment on the Epyx fixes. There was then inadequate time for Epyx to make the fixes." According to Needle, Atari decided to "punish" Epyx by withholding payment. In the end, this sent Epyx into financial turmoil, leading to its inevitable bankruptcy. Atari did hold out a lifeline – paying Epyx, but only on the condition that it handed over the Handy.

The deal

The deal obviously upset Mical and Needle. They asked their lawyers if they could leave Epyx, but they were advised that it would be seen as an overt action by them to damage Atari and that they would almost certainly be sued. The pair remained at Epyx until the hardware handover was complete, turning down an offer from Sam to work at Atari.

With Morse, Mical and Needle's involvement in the project coming to an abrupt halt, Atari took the Handy and renamed it the 'Lynx'. It was two years before the company released the console in September 1989 however, and by that time Nintendo's Game Boy had also been released. "Looking back, if we had decided not to go colour," says Needle, "We would have been a zero. The Game Boy really would have trounced us." As it was, the colour feature of the Lynx kept the machine in the limelight, although it wasn't easy. The Lynx cost \$189.95 and the Game Boy retailed for \$89.95. Many felt the Lynx was too expensive and there was a vicious circle of too few purchases, putting off third-party developers, which, in turn, led to fewer purchases.

As sales continued to fall, Atari tweaked the machine and created the Lynx II. It retailed for half the price of the original, and was smaller and cheaper to make.

Needle wasn't convinced however. "During the handover, [Atari's] mechanical engineer made some seemingly pointless changes," he said. "The guy told me that he always liked to put a piece of himself in any product he worked on. He changed the backlight electronics and the transformer design and reduced the battery life. But he also changed the high voltage capacitor to one with considerably more leakage at the oscillation frequency and it generated considerable heat. The new load on the batteries caused them to overheat." Nevertheless, sales did pick up.

Then along came Sega, who introduced us to the Game Gear in 1991. For Lynx, this meant the end was nigh. Although the Lynx remained the superior machine, the Game Gear benefited from Sega's advertising drive

ONLY \$99.95

LOTS OF GREAT GAMES AVAILABLE NOW!

In an attempt to boost sales, Atari reduced the price of the Lynx to just a whisker below \$100.

Checkered Flag was a top racer for the Lynx and highly sought after.

A plastic mock-up of one of the alternative designs for the first Handy.

Cartridges came in several different forms: flat, ridged and curved lip (as above).

Wonderful puzzle game Chip's Challenge was one of the Lynx's most endearing titles.

One of the many independently produced games by Songbird Productions.

and the Japanese company's resources. What was more frustrating was Game Gear's similarities to Lynx.

"Game Gear was an interesting issue," Needle remembers. "Sega was shown all of the Handy's innards and schematics and specs as part of an attempt to partner with them after the Epyx marketing fiasco. And to see what I consider to be pretty much a copy of the Handy was a bit infuriating." He continues, "I had become friends with one of the engineers at Sega, and during the last development stages of the Game Gear, after I had already left Epyx, Sega hired me to help with a few lingering product issues. I went to their Japan facility and they showed me the problems they were having. Some issues were just weak engineering on their part, showing me that they did not understand the functionality of the hardware they were copying. They had the output palette wrong, among other things."

Despite the problems, Dave Needle remains proud of the Lynx – "always have, always will", he says. Among his favourite games for the once groundbreaking handheld are *Chip's Challenge*, *Gates Of Zendocon* and *California Games*. "It's a matter of pride that no one created anything better for 12 years," he adds. When it comes to what went wrong, Mical maintains that, "All the Lynx needed was low cost and a huge library of software. But I place the blame for both of these in Atari's lap..."

ATARI LYNX: PERFECT 10 GAMES

IT MAY HAVE BEEN KO'D BY THE GAME BOY, BUT ATARI'S LYNX WAS STILL HOME TO SOME WONDERFUL GAMES AND ARCADE CONVERSIONS. DON'T BELIEVE US? THEN CHECK THIS LOVELY LITTLE SELECTION OF CLASSICS OUT

CHIP'S CHALLENGE

» RELEASED: 1989 » PUBLISHED BY: EPYX
» CREATED BY: CHUCK SOMMERVILLE

1 Puzzle games are almost two a penny on the Atari Lynx, but when the quality is as good as *Chip's Challenge* you don't tend to mind them cluttering up the console (or your perfect ten columns for that matter). While the concept itself is not particularly original (you basically have to move Chip around each maze in search of a set amount of computer chips) it has been put together with so much love, care and attention that you can't help but become smitten with it. Chip himself may be only a few pixels high, but he's full of character and you can't help but feel for him as he carries out his tricky quest. It may have been ported over to a number of different machines since its release, but the bite-size puzzles make this perfect fodder for Atari's handheld.

KLAX

» RELEASED: 1990 » PUBLISHED BY: ATARI
» CREATED BY: GREG OMI

2 *Klax* is easily deserving of a place in our top ten and not just because it features the sexiest videogame voice of all time (if you know someone who sounds sexier then let us know). Converted from the popular Tengen coin-op, *Klax* is a near perfect arcade adaptation that not only captures the authenticity of the original arcade game but also proves that the Lynx was no slouch when it came to hosting great puzzlers. Deceptively simple to pick up – all you have to do is stack three tiles of the same colour on top of each other, either horizontally, vertically or diagonally – *Klax* is Atari's answers to the mighty *Tetris*. And we actually prefer it!

RAMPART

» RELEASED: 1991 » PUBLISHED BY: ATARI
» CREATED BY: JEROME STRACH, ERIC GINNER

3 It might not match the majesty of its arcade parent, but there's still plenty to love about this extremely slick Lynx conversion. While it suffers from the obvious lack of a trackball, it still plays surprisingly well and doesn't let you down on later levels once the action speeds up. The mix of *Tetris*-style wall building and strategic blasting works perfectly and makes for a very unique experience. It's a lot tougher than the arcade original (mainly because all of the enemy ships can now drop off ground forces) and the loss of the third player is a bit of a shame (the Lynx could have easily included it), but this is otherwise another cracking conversion.

LEMMINGS

» RELEASED: 1993 » PUBLISHED BY: ATARI
» CREATED BY: IN-HOUSE

4 *Lemmings* has appeared on virtually every console and computer that has ever been made, so it should come as no surprise that the loveable mop-tops can also be found on the Atari Lynx. What is surprising, though, is just how good an adaptation of *Lemmings* this actually is. Despite the small screen and lack of a mouse there are no problems with this spot-on conversion. Your little fellas are perfectly animated and full of character, the levels are easy to navigate and it's incredibly easy to select each class. In fact, the only thing that is likely to put fans off is that you're going to be extremely unlikely to find a cheap copy of it.

“ZARLOR MERCENARY DOESN'T DO ANYTHING NEW, BUT WHAT IT DOES DO IS EXCEPTIONALLY POLISHED”

PLAY CHUCK SOMMERVILLE'S GAME NOW

S.T.U.N. RUNNER

» RELEASED: 1991 » PUBLISHED BY: ATARI
» CREATED BY: D. SCOTT WILLIAMSON

5 If anyone doubts the power of Atari's Lynx, simply shove a copy of *S.T.U.N. Runner* under their noses and watch them go into serious denial (we've tried it and it's fun). While it obviously can't hope to match the insane slickness and plentiful polygons of the arcade original (we still have dreams about that sleek, sexy cab), this Lynx conversion is amazingly polished and perfectly captures the atmosphere of its larger peer. Granted it's far more unforgiving than its bigger brother – you'll find the controls a little sensitive to begin with – and the gameplay is rather simplistic, but *S.T.U.N. Runner* remains a thrilling racer for Atari's handheld.

BLUE LIGHTNING

» RELEASED: 1989 » PUBLISHED BY: EPYX
» CREATED BY: STEPHEN LANDRUM

6 *Blue Lightning* may well have been one of the earliest titles to show off the Lynx's graphical grunt, but that's not to say it wasn't a superb game in its own right. Essentially Atari's answer to *After Burner* and *Star Fox*, *Blue Lightning* put you at the stick of an advanced military jet and required you to shoot down wave upon wave of enemy fighters. Sure it gets repetitive, but the action is always fast and frantic, the nine levels have a variety of nice environments to fly through and the scaling effects are truly fantastic. If you're looking for a good blaster then set your sights on *Blue Lightning*. It's far better than our rather naff pun.

XENOPHOBE

» RELEASED: 1992 » PUBLISHED BY: ATARI
» CREATED BY: GIL COLGATE

7 While the Lynx had many fine conversions, it was only really *Xenophobe* that managed to notably improve on its arcade original. For starters, the controls were streamlined and far easier to use (the arcade's three-button joystick was quite cumbersome), new items like the jetpack enabled you to fly around the space station without taking damage, while several new multiplayer modes kept the gameplay fresh and exciting. Add in some cartoony visuals that perfectly mimicked their arcade parent's and the end result is a highly enjoyable multiplayer experience that proves hunting down aliens can actually be a lot of fun.

ALPINE GAMES

» RELEASED: 2004 » PUBLISHED BY: DURANIK
» CREATED BY: ROLAND GRAF, JOHANNES GRAF

8 Normally we wouldn't cover a homebrew title in our perfect ten for fear of upsetting people, but *Alpine Games* is so brilliant that it would have been criminal not to include it. Essentially a homage to Epyx's sports games of old (why only *California Games* was released on the Lynx is beyond us), *Alpine Games* ups the ante considerably by featuring nine different events, nifty digitised music and some astounding-looking visuals that push the Lynx further than we've ever seen. The bobsleigh, in particular, looks absolutely amazing, but it's the finely balanced gameplay that really manages to impress. It's pricey, but certainly worth it.

TODD'S ADVENTURES IN SLIME WORLD

» RELEASED: 1992 » PUBLISHED BY: EPYX
» CREATED BY: PETER ENGELBRITE

9 We were going to go with *Bill And Ted*, but we decided that *Todd's Adventures* is slightly better (it was a really close call, though). Anyway, *Slime World* sees you thrown into a series of caverns in search of precious Slime Gems. Sadly for Todd, *Slime World* is literally covered in gross icky enemies, so you'll need to constantly keep his water gun filled up so you can clean up the pulsating planet. Like many Lynx titles, *Slime World* is very pretty and the slime-coated caverns that Todd explores are constantly in motion. An excellent *Metroid* clone with lots to do.

ZARLOR MERCENARY

» RELEASED: 1990 » PUBLISHED BY: EPYX
» CREATED BY: CHUCK SOMMERVILLE

10 With *Robotron: 2084* just missing out due to its overly complex control system, *Zarlор Mercenary* quickly swoops in and deservedly steals the last position in our prestigious top ten. Set across six huge and incredibly varied levels, *Zarlор Mercenary* doesn't do anything astoundingly new, but what it does do is exceptionally well polished. Destroyed enemies release coins that can then be spent on power-ups, there are some genuinely tough bosses to topple and the pseudo-3D visuals used throughout the game are very effective. There's even a superb multiplayer option that enables you to team up with three other pilots.

ATARI LYNX AND THE REST...

So what if it was steam rolled by Nintendo? There were still some choice (and not so choice) games available for Atari's gigantic handheld. Just check out the following two pages if you don't believe us

- 1 BatMan Begins
- 2 Pinball Jam
- 3 Viking Child
- 4 Todd's Adventures in Slime World
- 5 Ninja Gaiden III - Ancient Ship of Doom
- 6 Chip's Challenge
- 7 Gordo 106
- 8 BattleWheels
- 9 Desert Strike: Return to the gulf
- 10 Rampart
- 11 Warbirds
- 12 Fat Bobby
- 13 Checkered Flag
- 14 Steel Talons
- 15 Lynx Casino
- 16 Battlezone 2000
- 17 Dracula the Undead
- 18 Hard Drivin'
- 19 Blue Lightning
- 20 Electrocop
- 21 Pac-Land
- 22 xybots
- 23 awesome golf
- 24 bubble trouble
- 25 jimmy connors' tennis
- 26 kung food
- 27 scrapyard dog
- 28 Power factor
- 29 world class fussball
- 30 alpine games
- 31 crystal mines II
- 32 Ishido: The way of stones
- 33 Robo-Squash
- 34 Double Dragon
- 35 MS Pac-Man
- 36 california games
- 37 hydra
- 38 lemmings
- 39 super off-road
- 40 tournament cyberball 2072
- 41 xenophobe
- 42 A.P.B.
- 43 Dirty Larry: renegade cop
- 44 joust
- 45 shadow of the beast
- 46 ninja gaiden
- 47 basketbrawl
- 48 paperboy

THE RIGHTS TO IT. IT STILL

THRIVES TODAY

ATARI JAGUAR

LESS THAN ONE HUNDRED GAMES RELEASED, CORPORATE CEOS WHOSE BEHAVIOUR BEGGARED BELIEF, AND EVENTUAL PUBLIC APATHY; THE JAGUAR WAS A COMMERCIAL FAILURE. YET LOOKING BENEATH THE SURFACE THERE ARE MOMENTS SO AMAZING, THE MACHINE DESERVES AN ENTIRE BOOK DEDICATED TO IT. JOHN SZCZEPANIAK SETS THE RECORD STRAIGHT ON ATARI'S LAST SYSTEM

Atari's Jaguar is one of the most misunderstood and under-utilised consoles in gaming history. In many ways it's comparable to Sega's excellent Dreamcast: both had a short lifespan, have their own dedicated conventions, were the last consoles produced by their respective companies, and both continue to live on through thriving independent development communities who love the machines.

Despite being championed as an American machine, Jaguar was actually conceived by British minds in Cambridge, Britain becoming a key supporter of Atari's ill-fated beast. The planned VR headset, launch title *Cybermorph*, and critically acclaimed classics *Tempest 2000* and *Alien Vs Predator* were all developed by Brits (though *AVP* had American assistance).

Uncle Clive?

Martin Brennan and John Mathieson, who had left Sinclair Research after Amstrad took over, formed a Cambridge-based company in 1986 called Flare. It's reported they took with them, or were at least influenced by, the designs of the aborted Loki computer project being developed at Sinclair. Regardless of Loki's alleged influence, the pair began work on their own multiprocessor games machine, which eventually became the Jaguar. *Alien Vs Predator* lead programmer Andrew Whittaker has said on record that apparently some of the Loki technology also ended up in the SAM Coupé and as a result it "shared many interesting features with the Jaguar in terms of its video chip."

Brennan and Mathieson wanted to enhance their system's performance, so contacted Atari. Despite working on the eventually abandoned Panther console (which documents show had several similarities to Jaguar), Atari liked what it saw at Flare. Another studio, Flare 2, was formed to complete development of the new 64-bit system. Jaguar progressed quickly and in 1991 Atari cancelled the Panther, despite having said it was ready for production. Jaguar's launch (which some call hasty) was in December 1993, but Europe was severely undersupplied. It was even released in Japan, though wasn't popular (less than 5000 were reportedly sold), and in March 2006 Famitsu produced a satirical video on it. Strangely, Jaguar even officially made its way to Korea! Daryl Still, of Atari UK, spoke openly. "I was Marketing Manager, PR Manager, and Co-Managed the European Studios (producing titles like *Attack Of The Mutant Penguins* and *Fever Pitch Soccer*). There were only a dozen or so of us left, so we all multi-tasked!" Mr Still elaborated on initial UK reactions. "The press and retail reaction to the hardware itself was immensely positive. More importantly the

public demand was huge. Some of the titles were revolutionary. *Alien Vs Predator* was probably the first FPS that focussed on tension and fear instead of non-stop shooting. As a result, Edge misunderstood it entirely and gave it 4/10 and got completely lambasted by the public. The issue we faced was availability. Europe was promised 250K units for the first Christmas, but received only 25K in early December, with a further 25K on Dec 23rd."

Despite initially outselling the nearly triply priced 3DO, Jaguar didn't succeed. Many blame Atari for rushing; higher quality titles were delayed for several months. I asked Daryl Still about any negativity in the UK. "To be honest, we didn't detect any negativity regarding the machine. Some of the software titles were average,

JAGUAR FESTIVAL

Good buddies, a few beers, affordable merchandise, and 32-player networked Jag action; internationally held JagFests are the zenith of Atari gaming (image: Euro Jagfest 2004). We asked Kevin Manne, original co-organiser of the first 1997 event in Chicago, to tell us more about the now annual event.

"JagFest was a way for like-minded gamers to get together and enjoy Jag gaming. The biggest draw, I would say, is the networking abilities – JagFest is the only time you'll get to play a large network of Battlesphere, Air Cars or even head-to-head Doom. Not only would it be very expensive to buy all the necessary hardware, finding enough people willing to play locally can be a challenge. JagFest [also] gives fans the chance to see rare and one-of-a-kind items from each others' collections. Rarities such as the Jaguar VR, Jaguar Voice Modems, prototype and unreleased games are all fascinating pieces of Atari history."

The machines

but we always had more demand than we could supply for hardware. Coping with consumer demand and frustrations at Christmas was probably the hardest thing. There is nothing worse than a mother who cannot get what her child wants for Christmas, and we had them camping out in our reception in Slough." According to Mr Still, criticisms were raised not at the system, but their handling of it. "It was frustrating, because there was 12-15 of us TOTAL, doing a Europe-wide launch of a major electronic commodity with absolutely zero budget, getting pages upon pages of press coverage and building an enormous demand. And we were hearing that we were rubbish at marketing, from journalists who knew absolutely nothing about the reality of the situation. You felt like screaming at them 'C'mon then, you come and see if you could do any better with our finances.' But of course we couldn't say a word about it. We just had to keep on going."

The American side of things was markedly different according to Steven Kent, in his Ultimate History book. The Tramiels' reputation and previous tactics alienated many; some retailers refused to stock Jaguar. Only a few of the supposed 200 developers that pledged to make games delivered. Of these, several were lazy 16-bit ports which didn't take advantage of the hardware. With more powerful systems from Sony, Sega and

Nintendo on the horizon, public apathy set in. People also disliked the controllers. While having 12 numerical keys which you can customise with game-specific overlays was brilliant in theory, most found them cumbersome. Atari tried to remedy this with the Pro Controller, but few games utilised it.

In 1995, after two years of Atari haemorrhaging cash, Sam Tramiel had a heart attack. A year later Atari was 'reverse merged' with Hard Drive manufacturer JTS. Stock plummeted to record lows, the company went bankrupt, Jaguar ceased, and the Atari division was sold to Hasbro Interactive, later bought by Infogrames. Countless other publications have covered these events, but at Retro Gamer we tracked down, stalked, and like the proverbial Jaguar, pounced on those who were once there in the vortex.

In the Eye of the Jaguar

One of the problems was publicly proving Jaguar's strength, something not helped by confusion over 64-bit architecture. US magazines contested its power. Developers, those best to comment, saw things differently. Prolific assistant to 3D Stoooges, Kevin Manne spoke on media attitudes. "It's always been an 'us against them' feeling, trying to squelch common misconceptions. EGM had once said the Jag was only 64-bit if you added up the 'bitness' of multiple processors, when in fact [it] does have fully 64-bit components. Once a system gets a bad reputation, it's hard to gain mass acceptance."

Doug Engel of ScatoLOGIC, who co-developed the greatly underrated *Battlesphere*, and also ScatBOX hardware, is obviously a huge fan of Atari's console and responded fervently. "Jaguar was truly a '64-bit system'. Some people equate bitness with power on a linear scale. It's like equating the number of cylinders in a car engine with horsepower. Most people think a V8 has a huge advantage over a 4 cylinder, but [early 20th Century V8s had less power compared to modern 4 cylinder engines]. A 64-bit processor from 12 years ago is easily bested by a 32-bit processor made today. There

• If you're looking for a good adventure, try *Highlander* on the Jag CD. It was based not on the films, but on the animated series.

• Atari directly challenged the competition. Look, they're about to gobble up Sonic, Yoshi and Mario.

• Atari released the Pro Controller near the end, adding 3 extra face buttons and 2 shoulder buttons.

The highly acclaimed *Battlesphere*. Free-roaming combat plus countless ships, explosions, and special effects push the Jaguar more than any other game, showing just how powerful it was.

were lots of arguments saying the Jag wasn't 64-bit. Speaking as a developer, I can say it was!"

Even without the confusion of how much "bit muscle" its Tom and Jerry chips pushed, many labelled the M68000 processor as not only weaker than up-and-coming systems, but barely superior to past consoles. Engel contests this and elaborates. "The Jaguar was most definitely not underpowered compared to systems like the SNES and Genesis. It was difficult to program for because the development tools were in an unfinished state and the hardware had crippling bugs. There was no

knowledge base to consult and nobody had experience. Ten years later, there's a lot of sample code and many with experience, so though we still have to use buggy development tools, it's much easier to make games today than when it came out."

At the time no one harnessed the system's true power, only recently have developers really seen what's capable. Skilled programmer Steven Scavone, key member of 3D Stooges which released *Gorf*, still develops for Jaguar. Comparing it to systems he's worked on, Scavone elaborated on tech-specs, also explaining in laymen's terms. "It should be coded in as much assembler as possible. This machine flies when fuelled by assembler. The RISCs in proper concert with the 68k will do some absolutely amazing graphics. The Jaguar could [utterly] crush any 2D system. It's a lot easier to program in 2D for than the PSX or N64. You can thank the Tramiels for it being 'underpowered'. The chips were not complete and had bugs. The designers, who weren't experts in silicon design, missed fundamentals. Just one more register and [it could have run without stalling all the time]! If they [had fixed this], the Jag would have blown away the PSX. Later 3D titles

like *Battlesphere* proved that systems at the time were no match for it."

Quite a revelation! We questioned Scavone further about the PlayStation comparison. "The textures are cleaner. PSX is faster but much uglier and unflexible [since it's built into the] hardware. Jaguar is more flexible and can [remove texture] ugliness. Then there's the

VLM in the CD player, which blows PSX away in disc access speed, [which] was awful with load times. The Jaguar was surprisingly fast."

High profile coder Scott LeGrand, who co-developed *Battlesphere*

alongside Engel, gave his own comparisons. "The Jaguar was anything but underpowered. It had more computational firepower than anything else of that era, including the original PlayStation. [Jaguar] was actually easier to code for than the Saturn. However, PlayStation had hardware 3D acceleration, was a dream to code, and had Sony's marketing muscle behind it. Atari didn't stand a chance." PlayStation had built-in hardware acceleration; everything had to be done manually with Jaguar. LeGrand explains more, "BattleSphere might have looked better on the PSX [in terms of raw polygon count], but its gameplay would have suffered. The Jaguar's multiple CPUs let me do things with physics and AI that were a good five years ahead of the rest of the industry. It wasn't until *Halo* that I finally felt utterly outgunned."

Atari's Jaguar obviously had lots of untapped potential, so we challenged the developers on its failure. LeGrand laments "Destiny, pure destiny. But not for the reasons everyone thinks. The Jaguar was a dream to code compared to the PlayStation 2. The real reason is that the Tramiels didn't have the resources to put together an adequate developer relations program, nor did they spend money to [license] titles like *Mortal*

Jeff Minter is going to be really angry with us... But we preferred *Protector SE* over *Defender 2000*.

OTHER DEVELOPMENTS

Many exciting developments sprung from the Atari Jaguar. Many were cancelled, some were birthed into uncaring public arms, while others were created by fans. The Jamma Stick, Rotary Controllers (*Tempest 2K*), and specialist network equipment all came after the system died. Few know the Jaguar hardware was used for arcades. They added Hard Drives and tweaked the technology, but it shows the system's power; CoJag (Coin Operated Jaguar) powered the *Area 51* arcade game.

Then there was the cancelled Jag Duo (pictured), a combined Jaguar and CD system. There was also the planned VR headset, with a few working prototypes around, and voice modem which would have allowed voice communication during online multi-player.

They also intended for Lynx connectivity; AvP originally used it as a motion tracker, but this was eventually scrapped. Finally, there was Jaguar II which was semi-complete. There were no games, but fans are working to finish it.

The machines

Kombat 2 (would have been the smartest \$1million ever spent). Sony had money, big money."

LeGrand's colleague Engel complains there's too much to cover, adding, "Can't you write a book on this instead of just an article? Most of the problems relate to the fact that Atari was too small to compete with the giants. Jaguar was rushed because Atari didn't have the resources to [finish it on time]. Atari lacked the money to properly market it, and they made some poor choices when it came to [licensing] titles."

Arguably the biggest Jaguar collector in the world, Jason Smith of www.jaysmith2000.com, who provided resources for this article, agrees with Engel. "Atari marketing for the Jaguar left a lot to be desired that's for sure! A big part of the downfall without question."

Those working close to them weren't pleased with the Tramiels, as LeGrand explains. "The Tramiel kids meant well, all of them, but the skills required to run a corporation just weren't in them. These guys would run around poaching cash-starved, but innovative technology, and then inject the family fortune into it, until it [failed]. Then they'd pull the plug without telling anyone. Working with Atari was nonsensical. They were great at getting their technology into the hands of developers, but they didn't have the resources to put together competent developer support."

Internal Jaguar employee BeeJ West, who worked on BIVN, gave a lengthy and scathing critique of Atari USA. Some printable highlights, "The situation [there] might have broken less hardy souls. What did I think of Atari? Damn, there's an entire book there. I was utterly horrified by the state of affairs. [Anyone] could see something was rotten in the state of Tramiel. Everyone

who worked on *Trevor McFur* knew the game was a total stinker, and the development environment made [finishing] even such a lame game nearly impossible. [It] was so hostile and adversarial [at Atari, that everything] took eight times longer. If that hadn't been the case, Atari might still be in business."

Engel was calmer with his appraisal of the Jaguar situation, "They helped occasionally, but mostly ignored

us. I could write reams of stories about them, but I don't want this article to turn into a bash-fest. They did do some very positive things. They deserve credit for sending us a devkit when we were starting out and had no actual reputation as a developer."

Interestingly, the UK branch of Atari was run very differently by Daryl Still, and it's clear that working with the Jaguar meant a lot to him. "It was a real mixed bag of emotions, because the buzz was huge, the excitement terrific, but the frustration of not receiving inventory was soul destroying", he tells us. "There were some tremendously talented people there. Really committed people who just thrived upon working with great product, and there was no doubt that Jaguar was a potentially huge piece of hardware. We had total autonomy over how we ran things in Europe. The biggest problem was the US office couldn't see beyond their own markets and pretty much dominated the available inventory. This was a historical problem, dating back to the ST. If the US had learned from our [European success with the ST], and given us equal status with inventory and budget, I believe Atari could [have still been a] hardware force today. We produced some great hardware in those days, and backed them up with some super (and some less super) software

"THERE WERE LOTS OF ARGUMENTS SAYING THE JAG WASN'T 64-BIT. SPEAKING AS A DEVELOPER, I CAN SAY IT WAS!"

DOUG ENGEL

For the Global Gaming fans: One of many two-page Jaguar adverts found in Korean magazines!

Destroy entire cities with aplomb, in the German developed *Iron Soldier* – the sequel was later released on Jag CD.

The Jamma Joystick, by Dan Loosen of goatstore.com, is just one of many hardware pieces designed, manufactured, and distributed by fans.

Innovative and hugely anticipated, the eventually cancelled *Black Ice White Noise* would have played like a cross between *Shadowrun* and *GTA3*.

Alien Vs Predator was the game that convinced many to buy the system. Even today it's still a supremely playable FPS.

Information on dedicated Jaguar magazines is scant, but there were several inserts provided free with other mags.

titles, and I believe, by default, we set a number of practices that people like Sony learned from (both how to and how not to do things)."

Defence and Allure

At this point Karl Morris, who runs www.atari-explorer.com and went to great lengths aiding us with this article, speaks in Atari's defence, while also providing scans of their financial documents on his website.

"With respect to yet more Tramiel bashing, I hope this doesn't seep into the article.

Mistakes were made by Atari, but it was imperative the system launched in 1993. Atari pulled out all the stops to ensure Jaguar was a success. To say Atari was putting all its eggs into one basket is an understatement; Jaguar

had to work or it was curtains for the company. To bash the management who were working on thin-air budgets with a one-way-ticket product is silly. Great people worked there and got behind the product 100%; they all knew what was at stake, and when it started to go wrong and the numbers weren't adding up, and [Sam] had a heart attack, Jack came back and did what any sane person would do: protect his family's interests. Lets not harp on about how "the Tramiels killed the Jaguar" when it was [they] who made it happen."

Even with such deep debate, the atmosphere is forever jovial and amicable. Which many declare, is part of the allure the machine still has. Jaguar fans are a relaxed close-knit group; the regular JagFests prove this. I enquire further, about passionate support for a dead system. High profile collector Jason Smith comments, "I think the primary allure of the Jaguar is that it was Atari's final system. Atari has a HUGE following and the Jaguar, without question, was its most powerful offering. Another part for me is all the amazing hardware they were working on that actually became 'working' prototypes. The Jaguar VR, Cortina, Jaguar Voice Modem, etc. They were way ahead of their time."

Another big reason, and one that makes it worth tracking down today, is the continued release of games and independent development community that exists. Dreamcast and Jaguar coder Mickey McMurray reflects. "The biggest draw to the Jaguar is the fact that [it was] made as an open system.

The documentation, tools, and encryption keys are all available legally for anyone who wants them. Since the Jaguar is free for anyone to tinker with, people can release software, hardware modification and add-ons without fear of legal problems. The JagFests are very successful because of this; they have brand new games and hardware with which to keep Jaguar fans coming back."

This raises a fascinating precedent, since in 1999 after petitioning, Hasbro Interactive officially, and commendably, released the rights to Jaguar. Something unthinkable to other hardware companies. More importantly the encryption keys to both

"WITH A STRANGE SENSE OF BITTER IRONY, THE JAGUAR ONLY CAME TO LIFE AFTER ITS DEATH"

HOMEBREW KEEPS JAGUAR ALIVE

cartridge and CD games were discovered by Curt Vendel of the Atari Museum, hidden on long-forgotten Atari floppies that were sold after the collapse. Now anyone can develop games, especially on CD, that will run on unmodified machines. This makes owning a Jag CD essential, as many modern releases are on disc.

As well as coding their own projects and unlocking the system's true power, the fans petitioned companies like Telegames to publish stillborn titles. During collapse Atari was sitting on dozens of fantastic, though sometimes only semi-complete games, many of which it's argued would have saved Atari. With no licensing restrictions the community has been, and will continue, finishing these games themselves, then releasing them. Hence why some titles only came out in 2000 and beyond. With countless proto CDs in his possession, rather than hoarding them, Jason Smith set about making compilations and distributing them among fans. This is another highlight of the community; while unreleased Dreamcast prototypes bit-rot in the hands of private collectors, Jaguar fans, for the most part, happily share things. Which is why BIWN is freely available on the internet and why all profit made on Battlesphere was donated to charity. With so many developments that have happened in recent years, there has never been a better time to invest in a Jaguar. With a strange sense of bitter irony, the Jaguar only truly came to life after its death.

Special thanks to Jaguar Sector II and <http://www.jaysmith2000.com/> for providing developers' contacts. Thanks also to Karl Morris of www.atari-explorer.com and www.goatstore.com for assistance with this article.

Along with AVP, Jeff Minter's *Tempest 2000* is rightly heralded as one of the finest games on the Jaguar.

Not only is the post-mortem-released *Gorf* for the Jag CD absolutely arcade perfect, but it helped re-invigorate the independent development scene.

Ubisoft's sumptuously wonderful *Rayman* game, which according to sources began life on Jaguar as a proposed exclusive.

ATARI JAGUAR: PERFECT 10 GAMES

ATARI'S JAGUAR HAD SO MUCH UNTAPPED POTENTIAL THAT IT PAINS US TO SEE IT SO OPENLY SCORNE BY THE MAJORITY OF GAMERS NOWADAYS. FORGET THOSE FOOLS, AS WE REVEAL SOME OF THE SYSTEMS BEST GAMES

ALIEN VS PREDATOR

» RELEASED: 1994 » PUBLISHED BY: ATARI
» CREATED BY: REBELLION

1 Never mind the fact that *Alien Vs Predator* was released a good year after being a supposed launch title, Rebellion's game was a landmark title for both the Jaguar and first-person shooters in general, thus making it more than worth the wait. While *AVP* boasted spectacular visuals it was the sound that truly impressed. With no music, creators Rebellion used a selection of screams, explosions and gunshots to punctuate the silence of each well-constructed stage. It was gameplay where *AVP* truly excelled though, and while the floaty controls could annoy, the three main protagonists – human, alien or predator – more than made up for it.

PROTECTOR SE

» RELEASED: 2002 » PUBLISHED BY: SONGBIRD PRODUCTIONS
» CREATED BY: IN-HOUSE

2 If you're looking for a superb update of *Defender*, it's this excellent offering from Songbird Productions that you should be searching out and not Jeff Minter's *Defender 2000*. The graphics truly are stunning and feature some of the best 2D visuals we've ever seen on Atari's 64-bit console, hell, any console from that period for that matter. Sound is also excellent, with a great array of sampled voices and some rocking tunes that perfectly capture the frantic on-screen action. Insanely fast, full of excitement and sporting some very nifty power-ups this is a perfect example of twitch gaming and deserves to be in every Jaguar owner's collection.

TEMPEST 2000

» RELEASED: 1994 » PUBLISHED BY: ATARI
» CREATED BY: JEFF MINTER

3 Jeff Minter's *Tempest 2000* is justification-enough for picking up Atari's ill-fated console. Beautiful to look at, incredible to listen to, witnessing *Tempest 2000* in action is the equivalent of having a synapse explode in your brain, such is the impact of Minter's masterpiece. Forget the incredibly poor port of the original arcade game that has been included and just concentrate on spending all your spare time with *Tempest Duel*; a gripping deathmatch for two players and of course, the stupendously good *Tempest 2000*. With new enemies, the ability to jump, scintillating sound and those eye-melting visuals this is perhaps Minter on his finest form.

GORF CLASSIC (CD)

» RELEASED: 2006 » PUBLISHED BY: 3D STOOGES
» CREATED BY: JAMIE FENTON

4 The original arcade version of *Gorf* was developed by Jamie Fenton and released in 1981, featuring five progressive and very different levels, and also several digitised voice samples that heckled the player. The Jaguar CD port by 3D Stooges, which was created after the system's death and rekindled the development community, has the honour of being the only arcade perfect port to home systems that has all five of the original levels (due to licensing issues, the third *Galaxians* level was normally removed). Unfortunately, due to popularity and a low print run, this is now fairly rare and expensive on eBay, so you'll need a full wallet.

"REBELLION'S GAME WAS A LANDMARK TITLE FOR BOTH THE ATARI JAGUAR AND FIRST-PERSON SHOOTERS IN GENERAL"

PLAY ALIEN VS PREDATOR AS SOON AS POSSIBLE

IRON SOLDIER 1/II

» RELEASED: 1982 » PUBLISHED BY: ATARI/TELEGAMES » CREATED BY: ECLIPSE SOFTWARE

5 We're mentioning both *Iron Soldier 1* and *II* as they're perfect examples of what the Jaguar and Jaguar CD could do in capable hands. Both titles require you to storm around in a huge mech and lay waste to whatever is foolish (or unfortunate) enough to get in your way. Each game feature expansive environments (although the CD version has greatly improved visuals and a storming soundtrack) a variety of well-structured missions and some of the most amazing explosions in any Jaguar game. Some may balk at the slow pace of both games, but with so much to learn you'll actually be glad you have some time to think.

BATTLESPHERE

» RELEASED: 2000 » PUBLISHED BY: SCATOLOGIC INC » CREATED BY: 4PLAY

6 The epic space opera *BattleSphere* (both normal and enhanced Gold versions) is a triumphant example of what the Jaguar is truly capable of. Filled with clever references to popular sci-fi creations, you choose one of seven known intergalactic races (including humans), before being placed in a fully 3D sphere of space and battling it out to become champion. Visually nothing short of stunning, the dynamic AI also impresses, and for a time was unsurpassed. It's also one of the few games that supports up to 32 simultaneous human players over a network (although you're going to have to find a convention in order to experience this).

HIGHLANDER (CD)

» RELEASED: 1995 » PUBLISHED BY: ATARI » CREATED BY: LORE DESIGN LIMITED

7 The Jaguar and CD add-on were starved of traditional adventures and RPGs (the only other notable exception being *Towers II*). So adventures like *Highlander*, which was exclusive to the system, is something to get very excited about indeed. Based not on the film's franchise (which was killed by three totally unnecessary sequels) but rather the animated TV series, you play Quentin MacLeod on his quest against rogue immortal Kortan. Controls are comparable to *Resident Evil*; you're able to defeat enemies using fists, sword or a gun, while searching for items that allow progress. A unique and enjoyable title that's worth tracking down.

RAYMAN

» RELEASED: 1995 » PUBLISHED BY: UBISOFT » CREATED BY: IN-HOUSE

8 Decent platformers are few and far between on Atari's Jaguar, so when a title with the quality of *Rayman* comes along you can't really afford to miss it. Originally created exclusively for Atari's machine (it was later ported to the PlayStation and other consoles like the Saturn) Michael Ancel's platformer still looks sumptuous and boasts some utterly stunning locations. Filled with layer upon layer of parallax scrolling and beautiful, hand-drawn sprites it's an amazing technical achievement and perfectly shows off previous claims about the Jaguar's 2D power. Despite *Rayman's* toughness there's no denying it's a charming game.

BLACK ICE/WHITE NOISE

» RELEASED: 2004 » FREELY RELEASED BY: BEEJ WEST (DEVELOPER) » CREATED BY: ATARI

9 *Black Ice/White Noise* was not officially released due to being cancelled before completion; but since it was such an ambitious title and because the beta can be freely downloaded online, we thought it must be mentioned, as its history alone warrants several articles. The team had a unique vision which today is comparable to a cross between *Shadowrun* without magic and *GTA3*. Players would have been able to traverse a massive cityscape while completing missions, riding vehicles, shooting police, hacking computer networks, talking with NPCs, etc. Sadly, among other things, overly high ambitions killed the project.

MISSILE COMMAND 3D

» RELEASED: 1995 » PUBLISHED BY: ATARI » CREATED BY: VIRTUALITY

10 Despite the Jaguar's VR Headset never getting released, Atari still saw fit to release *Missile Command 3D*, which featured a VR version of the game few Jaguar owners will have been able to play. Apart from this obvious oversight the VR version in particular is great fun to play and gives you a clear example of just how immersive the game would have actually been. Starting off in an underwater base, you'll soon progress above ground and into space itself. All the while missiles are furiously raining down on you and despite the first-person viewpoint it perfectly captures the essence of the original game, which is also included.

ATARI JAGUAR

AND THE REST...

While you had to look very hard for them, Atari's Jaguar did boast some solid titles. Many of them are now extremely difficult to track down and can fetch a pretty penny on eBay. See how many titles you recognise...

- 01 Baldies
 - 02 Pinball Fantasies
 - 03 Troy Aikman NFL Football
 - 04 Highlander

ATARI INC

FORMED BY TWO ENGINEERS, ATARI ROSE TO DEFINE THE EARLY GAMES INDUSTRY. HOWEVER, ITS RAPID EXPANSION HID THE LOOMING THREAT OF BANKRUPTCY THAT DEFINED ITS EARLY DAYS, RIGHT THROUGH TO THE CORPORATE OVERINDULGENCE AND PERSONALITY CLASHES THAT OVERSAW ITS ULTIMATE DOWNFALL

INSTANT EXPERT

- Atari Inc was founded on 28 June 1972 but technically began in 1969 as a partnership between Nolan Bushnell and Ted Dabney called Syzygy Engineering.
- Atari's first arcade game was *Pong* in 1972. Its first consumer product was a home version of *Pong* for Sears in 1975.
- The Video Computer System (VCS), better known as the Atari 2600, began its life in August of 1975 and was released on 14 October 1977.
- Warner Communications bought Atari in 1976 for an estimated \$32 million. It gave away half of it in 1984 for no money – just promissory stock.
- Atari's top game properties are *Pong*, *Breakout*, *Asteroids*, *Centipede*, *Battlezone*, *Missile Command* and *Tempest*.
- Atari Inc affected the popular culture of the early Eighties to such a degree that it became synonymous with the use of high technology. It even affected US politics, as the term 'Atari Democrat' was actually created to describe Democrats who supported the development of high-tech industries to stimulate the US economy of the time.

Atari's origins go back to Ampex and a little-remembered division called Videofile. A document storage and retrieval system that used videotape and television displays to search for and reproduce documents, it was capable of recalling a full page out of the phone book and printing it accurately. An analogue engineer by the name of Ted Dabney had been working in the 'Input/Output' group at Videofile, responsible for the cameras and printers used to record and later print out documents, when he found himself with a new office mate. Just out of college, the young Nolan Bushnell had moved out to California from Utah after getting an entry-level job at Ampex.

Skill and personality-wise the two couldn't have been more different from each other. According to their boss, Ed DeBenedetti: "Nolan was the dreamer and Ted was the plodder. Ted's engineering work and ideas were conservative perhaps in the extreme. Nolan and later interns Al [Alcorn] and Steve [Bristow] were brilliant, inexperienced enough that they had no idea of what one could not do."

In a sense, Ted's experienced approach to engineering would serve well to give Nolan's inexperience and forward-looking manner a solid foundation as the two embarked on a side project together. Already enjoying daily games of Go in the office on Ted's custom-built board, Nolan had talked about wanting to pursue bringing computer games to

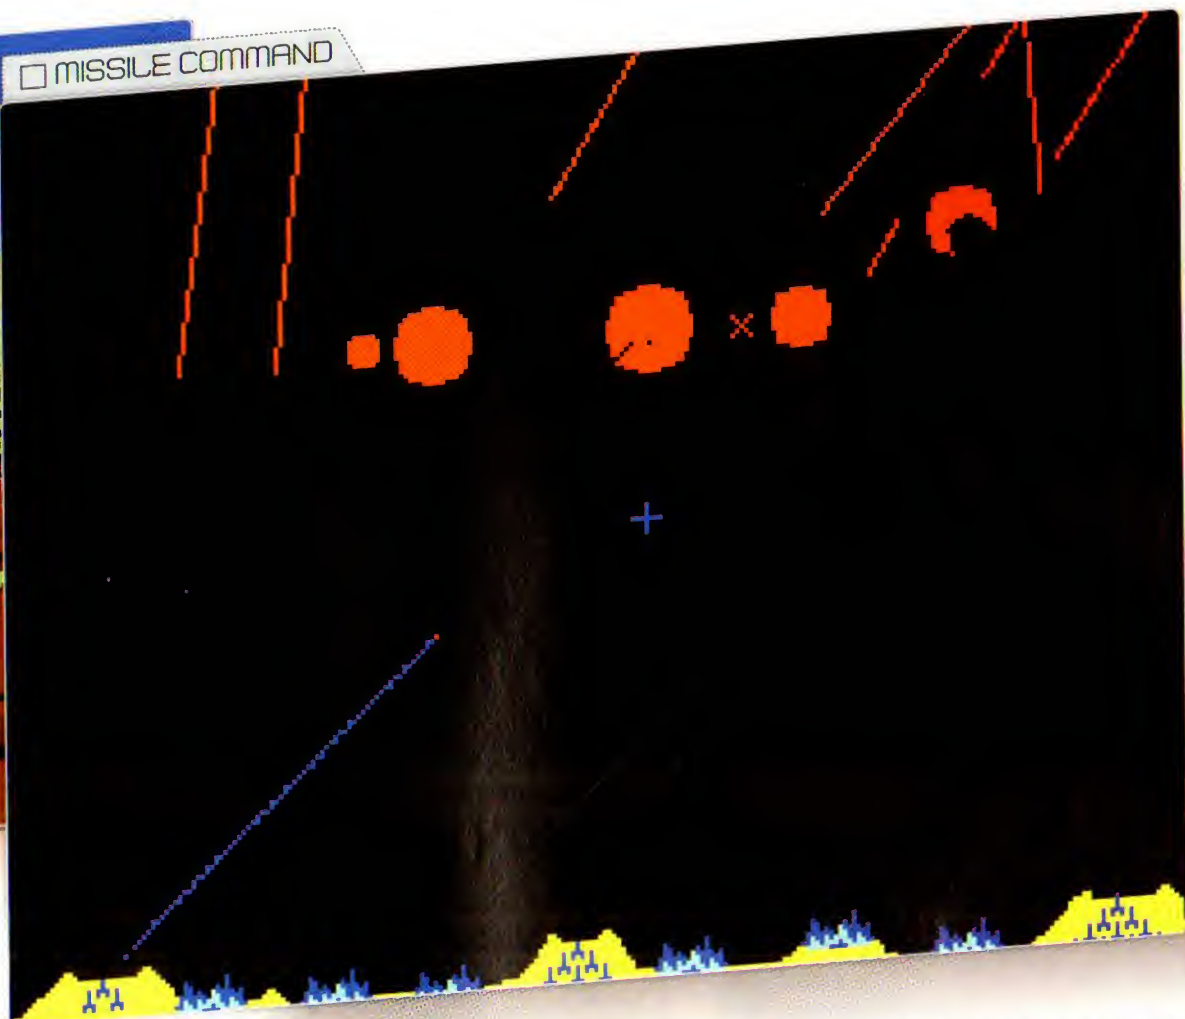

the arcade environment. Tapping the more experienced Ted, he began partnering with him on trying to make the dream a reality. According to Ted: "He took me off to Stanford to see [Spacewar!] so I could help him come up with ways to do such a thing."

The original plan was to bring the experience direct to the arcade via a PDP or comparable minicomputer, and a third partner with programming experience, Larry Bryan, was brought in to that end. It turned out to be a short partnership, however, when this approach was quickly found to be cost prohibitive, but they did get a name for their engineering group out of it – Syzygy Engineering. If this plan for an electronic arcade game worked out, the two planned to have Syzygy be a contract-engineering firm for the arcade industry.

When it was decided to move to a non-general purpose format – or 'state machine', where the game is comprised of zero code but rather hardwired through chip logic – it became Ted's turn to do the heavy lifting. He designed all the circuitry to put a spot on a modified television screen and move it around, and Nolan shopped it around for someone who may be interested in funding the development of a final product, as well as manufacturing and distribution. Finding closed doors everywhere he looked, and little interest in the arcade industry mecca of Chicago, he finally found a coin-op company locally that was interested. Nutting Associates had previous successes with electro-mechanical games such as *Computer Quiz* and saw the potential of this

TOLEN PLANS
BOOM AND DES

MISSILE COMMAND

new format. Hiring Nolan as lead engineer to finish adapting Ted's work into a game while performing other duties at the company, Nutting became the future of the industry for a short time.

Having talked Ted into leaving Ampex and joining him at Nutting, by the end of development Nolan was itching to have more input on the business side of things. The two left Nutting by the spring of 1972 and decided to make Syzygy Engineering their main source of income. Funding the startup with money from Nutting's purchase of their game *Computer Space*, and subsidising daily operations with a coin route, Nolan looked to get their first contract. Their first client was Bally, which contracted them to produce pinball playfields and, more importantly, an electronic driving game. Nolan hired former Ampex intern Al Alcorn to work on the proposed game, and allowed him to get acclimated to their video circuitry from *Computer Space*. Nolan had seen a demonstration of the first videogame console, the Magnavox Odyssey, that past May, and decided to have Al do an arcade version of its tennis game. By the time Al was done in August of 1972, Nolan was outvoted two to one to make Al's warm-up game, *Pong*, Syzygy's actual game for Bally.

It was during this time that Atari received its by now-legendary name. The name that would continue long after the original company disappeared. When looking to formally incorporate Syzygy Engineering, it was found that several other companies at the time were already using the name. Giving the clerk a list of names based on moves from Go, the clerk picked Atari, not knowing that he would be choosing the name of the company that would define electronic entertainment for years to come. On 27 June 1972, Atari Inc was officially born.

Nolan and Ted decided to keep the Syzygy name for the engineering portion of their venture, and use Atari for their outward-facing business activities.

A surprise hit

After putting several test cabinets of *Pong* out into the wild – most notably one at Andy Capp's Tavern that sat right next to a *Computer Space* unit – a funny thing happened. *Pong* was a big success, drawing in far more money than the *Computer Space* machines were, to the extent that the Atari staff were afraid that when they reported back to Bally on how the test run was doing for the machine, Bally wouldn't believe them. Wary of this, they under-reported the earnings numbers, and Bally still thought they were exaggerating.

With Bally stalling on accepting the game and looking to possibly pass it off to its subsidiary, Midway Manufacturing, and Atari knowing how well the game was actually doing, Nolan, Ted and Al had a very important decision to make: either let *Pong* sit in limbo to maybe be rejected altogether, or look to go into manufacturing for themselves. They chose the latter, and Ted concocted a plan that Nolan send a carefully crafted letter to Bally, suggesting that it officially reject *Pong* so that Atari could develop a new game for it. The letter worked, and Atari became a full design and manufacturing arcade company.

New horizons

From there the growth was explosive, with Nolan and Ted hiring people off the streets to fill the manufacturing needs, and Nolan hiring more engineers and management to help with the growth. Tension began to develop between Nolan and Ted on how the company

"HE DEFINITELY HAD NO IDEAS ABOUT TV GAMES OF ANY SORT"

TED DABNEY

BY THE NUMBERS

\$40 million The amount of profit generated by Atari as its golden age began in 1977, the year it released the hugely successful Atari 2600.

\$539 million The amount it lost in 1983, as the industry's crash was under way.

2 The number of competitors Atari had in video arcade games in 1972.

25 The number of competitors by 1974.

\$98.95 The cost of Atari's first home console, Pong, in 1975.

\$189 The cost of the Atari 2600 at launch.

1 The number of manufacturers making games for the Atari 2600 at its 1977 release. Of course, it was just Atari itself, although third-parties would quickly appear.

145 The number of manufacturers making games for the 2600 worldwide at the time of the crash.

5,000 The number of shares allegedly sold by Ray Kassar based on insider knowledge of Atari's performance.

The developers

WHERE ARE THEY NOW?

Nolan Bushnell

After leaving Atari, Nolan headed his Chuck E Cheese Pizza Time Theatre until facing bankruptcy. Funding several start-ups under Catalyst Technologies in the Eighties and briefly returning to video arcade games under Sente, he ran a string of entertainment companies including PlayNet and uWink, which eventually closed due to poor market performance. He is currently partnered in Anti-Aging Games and is an advisor to the current owner of the Atari brand, Atari SA (formerly Infogrames).

Ted Dabney

After leaving Atari Inc in 1973, Ted worked for arcade company Meadows for a time as well as several other non-arcade engineering jobs. He even briefly worked for his ex-partner again when he created the pizza number callout system for the early Chuck E Cheese, as well as the Chuck E Cheese-branded *Isaac Asimov Presents Super Quiz* arcade game in the late Seventies. He's currently enjoying retirement while reacting to the recent interest in his involvement in early videogame history with surprise, wonder and gracious interviews.

Al Alcorn

After leaving Atari Inc in 1983, he became an Apple Fellow in 1986 before moving through a string of engineering management positions at various entertainment companies in the Nineties and early 2000s. He's currently VP of engineering at uGetit, a mobile social gaming firm that combines gaming with 'social shopping'. Former Atari employee Roger Hector also joins him there.

Steve Bristow

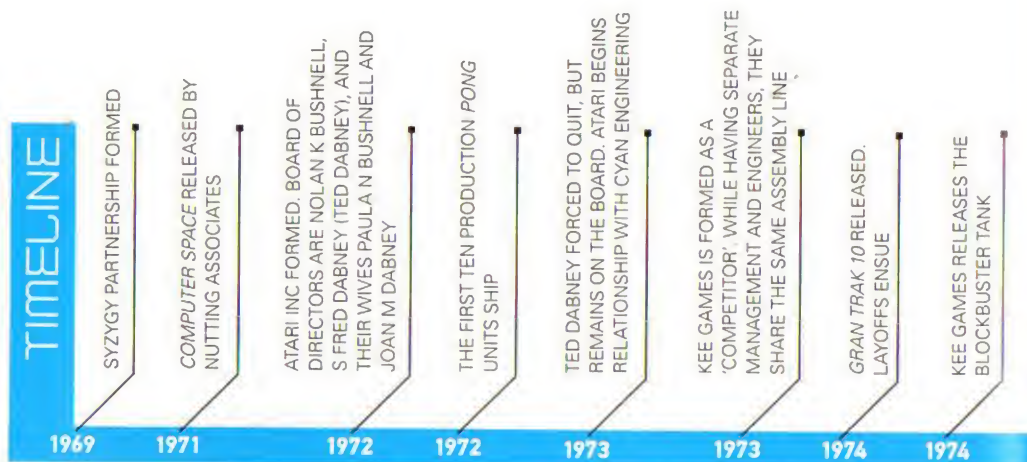

Steve decided that he would move on and left Atari back in 1984 after more than a decade in service there. Since that time Steve has worked as an engineer at various communications firms. He's currently employed at headset manufacturer Plantronics.

"NOLAN HAD FIGURED THAT PEOPLE WOULD SPEND MORE MONEY ON WHAT THEY WANTED, NOT WHAT THEY NEEDED"

AL ALCORN

TIMELINE

should be running, however, and Nolan decided that there wasn't room for two heads – a fact that became obvious to Ted when Nolan hired someone to come in and help restructure the business and employee roles. When they asked Ted what he did at Atari, he knew his time was up; he was forced out of the company, with management firmly in Nolan's hands, as Atari began its 'Innovative Leisure' period.

By continuing to pump out new games based on sports themes while doing engineering research for an eventual move into the consumer market, Nolan looked to stay ahead of the game. As Al Alcorn relates: "Nolan didn't want to define us as the best coin-op game designer and manufacturer; instead he focused broadly on the entertainment business. We were creating new, disruptive products in the leisure industry. Nolan figured people would spend more money on what they wanted, not what they needed." But things soon took their toll on the fledgling company.

Nolan had made some bad hiring decisions for the financial management portion of the company, and it soon needed to lay off employees. To make matters worse, it started facing intense competition from others entering the videogame market, including old industry hands like Bally and Chicago Coin, and new companies like Allied Leisure. Already competing for a spot at the well-established coin-op distribution table, Nolan came up with the idea to create a 'competitor' to increase the cash flow of the company. It would have its own building, exhibit on its own at the industry shows, and have its own purchasing, sales and engineering group, which would include another former Ampex intern, Steve Bristow, but all its manufacturing would be done on the Atari assembly line. This company, Kee Games, could clone Atari titles, allowing the company to sell them 'exclusively' to two distributors at once.

The wheels come off

Financial disaster struck in the form of *Gran Trak 10*. The game was so badly engineered that they started coming back to Atari in droves, forcing Al Alcorn to come out of

his sabbatical and redesign them, and forcing an even more lengthy delay to this already costly game.

Then, on top of that, an accounting error set the selling price of each unit to \$995, when it cost \$1,095 to manufacture it in the first place. It resulted in pushing Atari even further towards bankruptcy, and the company ended up losing half a million dollars between 1973 and 1974. By the end of 1974, Atari began to fully merge Kee into its parent and offloaded its Japanese operation to Nakamura Manufacturing Co, (now Namco).

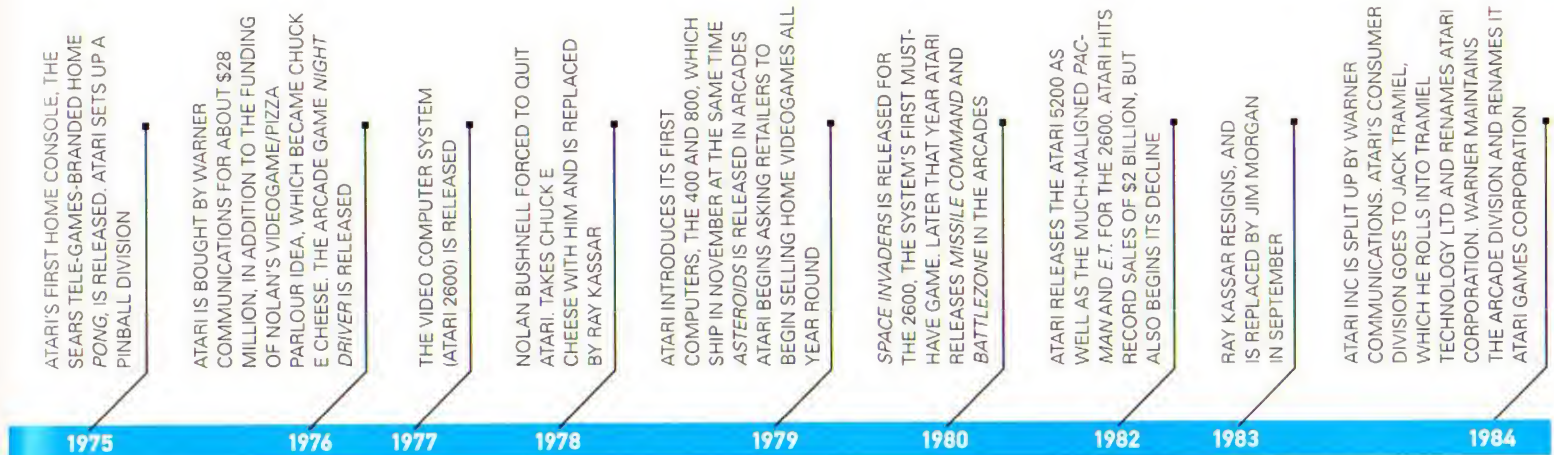

Things started looking a bit better in 1975 as Kee's management entrenched itself at Atari. Kee president and Nolan's next door neighbour Joe Keenan became president of Atari; Gill Williams became VP of manufacturing, helping to smooth out issues there; and Kee's lead engineer, Steve Bristow, became VP of engineering. Along with Steve came top engineering talent and future stars like Lyle Rains, who, together with Steve, had created the blockbuster *Tank* at Kee. Several arcade classics would be released in 1975 that would go on to become more known for their Atari 2600 versions but served the ultimate goal of helping Atari get back on track: *Anti-Aircraft*, *Jet Fighter*, and the multiplayer *Indy 800* were just a few of the games that were released. The biggest development, though, was the fulfilment of Nolan's wish for Atari to enter the consumer arena.

Homecoming

Al Alcorn and several engineers had been working on bringing *Pong* to homes. The move to the consumer market meant shrinking the large logic-based arcade board to a small integrated circuit, for which a partnership with chip manufacturer Synertek and its IC designer Jay Miner was formed. The end result was a product that put Atari on the map in the consumer market when it released through Sears in time for Christmas 1975. The research and development firm Cyan was also busy during *Pong*'s home release, working on a microprocessor-based home console that had the potential to more than make up for the *Gran Trak 10* fiasco.

Still realising that it wasn't enough to completely save the company and expand operations like he wanted to, Nolan began looking for more investors in Atari, and eventually, an actual buyer. As 1976 began, the buyer appeared in the form of Warner Communications. Warner had been on a buying spree to expand its operations, and the acquisition of an expanding videogame firm like Atari fit nicely into its plans. The deal was signed in October 1976, officially making Atari a Warner subsidiary.

Under Warner, development of Atari's consumer line began to blossom, the most prolific aspect of which was Cyan's microprocessor-based game console. First

codenamed Stella and then officially named the Video Computer System (CX-2600), it was released in 1977 and proved to be the path to true greatness for the company when it became an icon of the videogame industry in the early Eighties. It sold well that first season in 1977 but proved financially harmful to Atari the following year when manufacturing delays caused a shortage of the console for the 1978 Christmas season. As in the arcade industry years before, Atari was soon joined by competitors eating up the new console market – Bally with its Professional Arcade, Magnavox and Philips with the Odyssey2, RCA with the Studio II, and programmable console pioneer Fairchild with its Channel F a year before Atari's console. Atari needed something to separate the VCS from the pack.

Also contributing to Atari's familiar financial problems for 1978 were a lacklustre arcade line-up of forgettable games, such as *Sky Raider*, *Ultra Tank* and *Smokey Joe*. To make matters worse, there was tension between Nolan and Warner Communications. Nolan had been accused of being a lax CEO since the purchase, almost "checking out" of the much-needed daily running of the company, and by his own admission that was the case. Consequently, it left more room for Warner and its installed executives to flex their muscles, such as Raymond Kassar, the head of the consumer division. It didn't help matters that Nolan began butting heads with Warner on issues like the future of the pinball division, or even the future of the VCS.

By the autumn of 1978, Nolan had crossed the line by trying to hold meetings in secret without Warner staff knowing about them. Warner put Nolan out to pasture after a reorganisation plan and, like Ted years before, he was left with no recourse but to quit that December. Ray Kassar was now left in charge and

began heading what many consider the golden age of the company, if not the entire Atari brand. Not without a little speed bump to start out with, though.

Under new management

Shortly after coming to the company, Ray had begun bumping heads with some of the Video Computer System programmers, calling them "high-strung prima donnas" in an off-the-record portion of an interview

with the San Jose Mercury News that ended up getting published. A meeting designed to be a pep talk in early 1979

proved to be the last straw for some, as he managed to alienate even more.

VCS and Atari 400/800 engineer Joe Decuir related: "Ray called a meeting of the entire engineering team, coin-op and consumer – a bit of 'blah blah', and then he started talking about what we were going to do. He was excited about the [400 and 800] computer. He said we were going to sell them in designer colours so that women would buy them, and that we would also have home decorating software. A number of women I knew in engineering decided to resign because of this. One of the VCS programmers asked him how he was going to deal with the creative talent – the game designers. He said he knew about creative types from dealing with towel designers at Burlington Mills, his previous company. A core of programmers were disgusted, and formed Activision."

Fortunately, much of the coin-op talent stayed on to thrust Atari to the front just as the market began exploding thanks to the release of Taito's arcade smash *Space Invaders*. A string of now-iconic hits were released from 1979 onwards, including Ed Logg's *Asteroids*, the vector-based *Battlezone*, *Centipede*

(another Logg project which he worked on with Dona Bailey) and more. The consumer division and its Video Computer System rode the wave in 1980 after a timely licensing of *Space Invaders* for the console came to fruition. Giving the lagging console its killer app, it was soon joined by an expanding third-party market thanks to Activision, and sales really took off.

The catalyst for Atari's golden age was Warner Communications itself. As a powerhouse media company, it began leveraging its wide net of subsidiaries to add to Atari's public presence in the videogame craze of the early Eighties that it dominated. What many now take for granted or attribute to Nintendo during its Famicom/NES heyday was actually pioneered by Warner during this period. Atari-themed

HOLOGAMES

As the electronic toys craze hit in the late Seventies and early Eighties, Atari had a brief foray into its own handheld electronic devices and board games under its new electronic games division. Starting in 1978, Atari released *Touch Me*, a handheld game based on its own arcade game of the same name, which competed with and lost against a game from Milton Bradley inspired by *Touch Me*, *Simon*. Atari planned to follow up with handheld games based on arcade properties like *Breakout* and the licensed *Space Invaders*, and even planned advanced tabletop hologram-based products like the *Atari Cosmos* and *Atari Spector*. Alas, for Atari it was never to be. By the early Eighties, the electronic games market was lagging in the US and Atari shut down the division. Atari not only lost some advanced games in the process, but it lost the company's third employee, Al Alcorn, who had been heading the *Cosmos* project and quit shortly after.

Enjoying a round of *Battlezone* during its development are: (left to right) Lyle Rains, Dona Bailey, Ed Rotberg, Jeff Boscole and Owen Rubin (seated).

magazines, movie placements, toys, clothing, party favours, costumes, jewellery, storybooks, big budget cinematic commercials, collectables and more built the brand into a commercial juggernaut.

By 1982, Atari had become

Warner Communications' golden goose. Comprising 80 per cent of the videogame industry, Atari was doing slightly over \$2 billion in sales and producing more than half of Warner's \$4 billion in revenues, and over 65 per cent of its profits. Warner saw only continued growth, and did what it could to force what should have been considered unmanageable growth, if not a bubble waiting to burst. This included frequent second-guessing of Atari management, creating a dual management. Money-losing deals such as the now-legendary *E.T.* tie-in were forced on Atari, and a string of ongoing projects that would have put the company far ahead in both consoles and

computers were cancelled in favour of more incremental advancements like the Atari 5200 console and the XL series of computers. Not that some of Atari's management, such as Ray Kassar, weren't enjoying

their perks; Learjets, limousines, yachts and luxury office remodelling were all on the menu.

The signs of the end for the company were beginning as it enjoyed its record profits that

"INVESTORS BEGAN TO QUESTION THE VIABILITY OF THE INDUSTRY"

THE CRASH BEGINS...

year. By August of 1982, warehouses around the US began piling up with unsold inventory thanks to the glut of competing consoles on the market. As Gordon Crawford, a representative of the investment group that brokered the original sale of Atari to Warner related: "At the January '82 Consumer Electronics Show there were three or four new video hardware systems and about 50 new software systems – all the warning lights went on for me. Then, at the June CES, it was worse! There

Warlords was an excellent multiplayer game that still remains very popular today with Atari fans.

were about 200 software systems. This was a business where the year before it [was] essentially a monopoly, and now there were literally hundreds of new entrants."

Warner and Atari management became partners in a cover-up of how Atari was starting to suffer.

Producing artificial reports and a trumped-up projection of earnings for the final part of 1982, members in both management groups began selling off shares to insulate themselves. The most notorious example was Ray Kassar himself, who did so shortly before the December 1982 announcement that earnings were far short of the previously announced projection. It eventually led to him being forced from his position at Atari by that summer, but the damage was already done to the industry.

The bubble bursts

Shock waves spread as investors began to question the viability of the entire videogame industry, and stock prices plummeted. Layoffs began at Atari that January, and throughout the rest of 1983 and 1984 many of these new competitors that Crawford had witnessed

SIX OF THE BEST

Asteroids [1979]

The classic space shooter that influenced a generation, and it's still fun to play. While most will have to settle for playing this game on pixelated technology, nothing compares to playing in its original crisp vector monitor format.

Centipede [1980]

Another innovative game, *Centipede* improves on the bug theme initiated by *Galaxian*. Set in a dynamically changing garden playfield and complete with vibrant colour scheme, this top-down shooter proved a smash hit for Atari.

Warlords [1980]

Still one of the best multiplayer video arcade games of all time, its home port for the 2600 was just as fun and one of the only times you'll hook up four paddles. The arcade version includes a breathtaking 3D cut-out reflected backfield.

The Atari Specter, a 'holoptic' tabletop game that never saw release.

Atari Specter, 1-Player Atari Holoptic Holographic Game System Prototype

began closing. The videogame market crash had begun and it had begun in earnest.

Atari tried to minimise its losses by starting up advanced research divisions in computing and graphics, as well as expanding its areas of consumer reach in markets like next-generation medical devices and telephone research.

By September of 1983, Warner had decided to bring in James Morgan, VP of tobacco company Philip Morris, to replace Kassar and help turn the company around. However, Warner began mounting heavier and heavier earnings and stock losses as Atari lost millions by the day, and by winter of 1983 Warner itself was facing a hostile takeover by Australian publishing magnate Rupert Murdoch. In January of 1984, Warner brought in a firm to evaluate all its holdings and formulate a plan of action, and Atari was at the top of the list of subsidiaries that it was suggested to dump. The Murdoch takeover was averted that March after Warner decided to buy out his stock, but the writing was already on the wall for Atari by then. Warner began looking for any companies that

would buy it outright, but when it couldn't, Atari was eventually split into pieces.

The consumer division and most of Atari's manufacturing and distribution capabilities were soon sold to Jack Tramiel in exchange for no money down and the taking on of most of Atari Inc's debt. Folding it into his Tramiel Technologies Ltd (TTL), he renamed TTL to Atari Corporation and began a new chapter of the Atari brand in the consumer arena. The still-profitable coin division, responsible for Atari's arcade output, was initially kept and reformed as Atari Games, and soon after majority ownership was sold to Namco.

Much like a last-second swoop of the paddle in Pong to save you from your opponent scoring that winning point, the Atari brand was rescued from being completely wiped out in 1984 and would survive the crash. However, the drama, successes and failures were far from over...

Special Thanks: Curt Vendel, Jerry Jessop, Ted Dabney, Steve Bristow, Owen Rubin, the Smithsonian.

THE NAMCO CONNECTION

In 1974, due to mounting losses, Atari decided to sell its fledgling Japanese operation, run by Hideyuki Nakajima, to Namco. Hideyuki agreed to stay on and run Namco's new division, which would initially release licensed Atari games before moving on to producing its own. Thus started a long partnership between the two companies. By the early Eighties it was Atari that was licensing out Namco games, and these were such big hits that many are frequently regarded by many as Atari-created titles today, such as *Dig Dug*, *Pole Position* and *Xevious*.

By February 1985, Namco purchased the Atari arcade division, by then known as Atari Games. Hideyuki was sent to oversee all of Namco's US operations, and by 1987 had pooled his own money together with other Atari Games employees to buy the company from Namco and make it employee-owned. Shortly after the purchase he created Tengen to allow Atari Games to enter the home console market. In 1994, Hideyuki and the rest of the Atari Games staff sold their company back to Warner, then known as Time Warner. Sadly, Hideyuki's long association with the Atari brand would itself end later that year when he passed away on 11 June 1994 from lung cancer.

The Camp Experience That Lasts a Lifetime.

Atari ran several camps across the US, where kids could program their Atari 800 in between distractions like swimming and hiking.

Tempest [1980]

Atari's first colour vector game, this fast-paced shooter that has you rotating around geometric shapes is again one that just looks best on a vector monitor. A capable home version wasn't released until *Tempest 2000* for the Jaguar.

Missile Command [1980]

Global thermonuclear war, Atari style. The home ports dumbed down the gameplay for use with a single joystick and button. Accordingly, Atari engineer Dan Kramer was inspired to design a home version of the arcade trackball.

Tank [1974]

A classic that many will never have a chance to play, as it's a discrete logic game that therefore cannot be emulated. It's satisfying using dual sticks to manoeuvre your tanks through a maze while you attempt to blast your opponent.

ATARI CORPORATION

INSTANT EXPERT

- Atari Corporation was formed from merging Atari, Inc's consumer division with Tramel Technologies Ltd. It was spelt 'Tramel' instead of 'Tramiel' so that people didn't mispronounce the name.
- Jack Tramiel bought Atari's consumer division after being ousted from Commodore. It was purchased primarily for its manufacturing and distributing.
- The Atari 520ST was Jack's answer to his fear of the Japanese entering and dominating the US computer market.
- Atari Corporation re-released the Atari 7800 after settling debts with the developer GCC. It was not in response to the release of Nintendo's NES as many thought.
- The XEGS was meant to be the "5200 done right", also using Atari's 8-bit computer internals but making the console expandable to a full Atari computer with the addition of a keyboard.
- The Atari Lynx was developed under software publisher Epyx as the Handy. Atari Corporation initially licensed it but received full ownership of the hardware after Epyx went bankrupt.
- The Atari Portfolio was the world's first MS-DOS-compatible palmtop computer.
- The Atari Falcon was the last computer ever sold under the Atari name. It was on the market for just a year.

OUT OF THE ASHES OF ATARI, INC ROSE A NEW COMPANY, ATARI CORPORATION, AS WELL AS A SECOND CHANCE FOR RECENTLY OUSTED COMMODORE FOUNDER JACK TRAMIEL. IT WASN'T AN EASY TRANSITION...

Normally, coming back to work from a 4 July weekend in the US is an uneventful affair. It's an extra-long weekend, and employees are refreshed after spending time with friends and family celebrating America's independence. Even more so for 1984's celebrations, as the fourth fell on a Wednesday that year and many employees at Atari took off the two preceding days to have a nice five-day weekend. Those same employees found themselves coming back on the fifth to a company ripped in half. Literally.

Over that weekend, Warner Communications executives had conducted a series of secret negotiation meetings with former Commodore head Jack Tramiel for the purchase of Atari's consumer division as well as its distribution and manufacturing network. So secret that Atari's own CEO, James Morgan, had no idea until he was called into one of Atari's meeting rooms to sign the papers. Signing on the dotted line, the consumer division was given to Jack for no money down – just \$240 million in long-term notes, and warrants for a 32 per cent interest in Tramiel's new company, Atari Corporation. Warner kept the coin division of Atari, Inc, and Morgan stayed on to oversee the company's further dissolution and its restructuring into the coin-driven Atari Games. Both companies would share Atari, Inc's game properties, with Jack's new company owning the trademarks and home rights. The Atari logo would be shared by both as well, under the stipulation that the

coin company would have to include the word 'Games' under its logo. The ensuing transition was fast, furious and sloppy. No long period of board approval since it was just a portion of the company being sold, no time for employees to make transition plans, no time for the wrapping up of ongoing projects and business deals, no time for anything other than mass chaos.

Even Jack had no idea what he was physically getting in the deal, and proceeded to lock down buildings to begin a month-long process of inventory and project evaluations. At that time Atari had consisted of 70 buildings throughout Sunnyvale, Santa Clara, San Jose and Milpitas. The main Sunnyvale headquarters alone had around 35 buildings, whose functions were mixed enough that some of the consumer division's advanced research operations were housed in the coin division's headquarters, unbeknownst to Jack. At other buildings where much of the prototype, promo and project materials were kept, people started pulling up vans and U-Hauls to cart off items en masse. The company mainframe was no less susceptible, and many started deleting their work directories and emails in protest, hiding much of the recent work done under Atari, Inc from Jack and his people.

The projects and buildings weren't the only thing being appraised. Jack and his management team also had to evaluate all the employees that had been part of the consumer division to decide who they were going to take to the new company. Jack's son, Leonard,

"OUR GOAL WAS TO TAKE WHAT WE HAD AND TURN IT INTO A FUNCTIONAL AND PROFITABLE COMPANY BEFORE WE RAN OUT OF MONEY"

LEONARD TRAMIEL

was tasked with leading the project and personnel evaluations. Those who passed joined the new Atari Corporation, and those who didn't were technically already out of a job with the collapse of Atari, Inc. "Our goal was to take what we had and turn it into a functional and profitable company before we ran out of money," said Leonard recently. "Hopefully long before. The need to act quickly was obvious for many reasons. It would save money and shorten the anxiety of not knowing. It was really awful; about 1,000 people lost their jobs in about one week."

One humorous tale did emerge from that time period, however, on a trek up to Atari, Inc.'s coin-op headquarters to interview prospective recruits. As Leonard and a colleague entered the building, an employee got on the PA system and warned, "Imperial troops have entered the building," as if Darth Vader himself were entering the rebel stronghold. "I wound up hiring him," recalls Leonard.

Jack was still in a precarious financial position, though. He had sunk millions of his own money into the new company to keep operations afloat during July and August while pursuing the mountain of debt owed to Atari, Inc. that Warner had him take on, intending to

collect it and use it to fund operations for the longer term. Only nobody was paying, and by August Jack was already struggling – a situation that continued into 1985 and resulted in several renegotiations and financial assistance from Warner. To make matters worse, Jack had also taken on most of Atari, Inc.'s bad debt as part of his deal, so Warner could get the losses off its books. Likewise, a number of expected money-making products had stayed with Warner, including the recently announced Atari 7800. Adding to the worries, it wasn't more than a few days after the negotiations that his old company, Commodore, fired a shot across his bow by filing injunctions against his new VP of R&D, Shiraz Shivji, and two other ex-Commodore engineers. They were accused of theft of trade secrets and barred from doing any computer work, effectively shutting down development of his planned new computer for the month of July.

Leonard found the means to strike back in the form of a cancelled cheque. Unbeknownst to them, Warner and Atari, Inc. had struck up a deal with the very company that Jack had visited back in April: Amiga Corporation. While Shiraz and other engineers were locked up in a hotel room in April and May,

BY THE NUMBERS

6 The number of consoles released under Atari Corporation: 2600 Jr, 5200 (re-release), 7800, XE Game System, Atari Lynx, Atari Jaguar.

2 The number of titles held by Sam Tramiel at once when he was both CEO and president of Atari Corporation.

3.77 million The number of Atari 7800s sold in the US between 1986 and 1990.

28 The number of Atari computer models released between 1985 and 1993.

51 The number of games released by Atari Corporation for the 7800.

73 The number of games that Atari released for the Lynx.

42 The number of games Atari that released for the Jaguar.

250,000 The number of Jaguars manufactured.

125,000 The number of Jaguars actually sold between 1993 and 1995.

1 The number of employees left at the time of Atari Corporation's closure.

5 million The number of Lynxs Atari sold.

6502 The 8-bit processor used in the Lynx.

The developers

WHERE ARE THEY NOW?

Jack Tramiel

After retiring once JTS collapsed, Jack has spent most of his time out of the limelight. Save for a rare public appearance in 2007 in honour of the 25th anniversary of the Commodore 64, he spends his time enjoying his extended family and donating to places like the US Holocaust Memorial Museum. Unfortunately tragedy struck the Tramiel family when Jack died of heart failure in April 2012. He was 83.

Sam Tramiel

Sam is currently involved in Tramiel Capital, Inc. TCI was founded by Sam in 1996, through which he holds real estate with other family members and makes investments in both high-tech and low-tech businesses, helping to fund a new generation of tech entrepreneurs.

Leonard Tramiel

After Atari Corporation closed down, Leonard went back to his astrophysics roots and became an eighth-grade astronomy teacher. He's also volunteered at the Chabot Space & Science Center since. In 2010 Leonard became the co-ordinator for the Center For Inquiry San Francisco, where he promotes evidence-based inquiry into paranormal and fringe science claims, alternative medicine and mental health practices, religion, secular ethics and society.

Shiraz Shivji

After leaving Atari Corporation in 1989, Shiraz worked for Momenta International, where he developed a pentop computer. By 1999 he found himself as VP of engineering at Canesta, Inc – a designer of low-cost electronic perception technology. He is currently CEO of Giotti, Inc, a medical technology research firm.

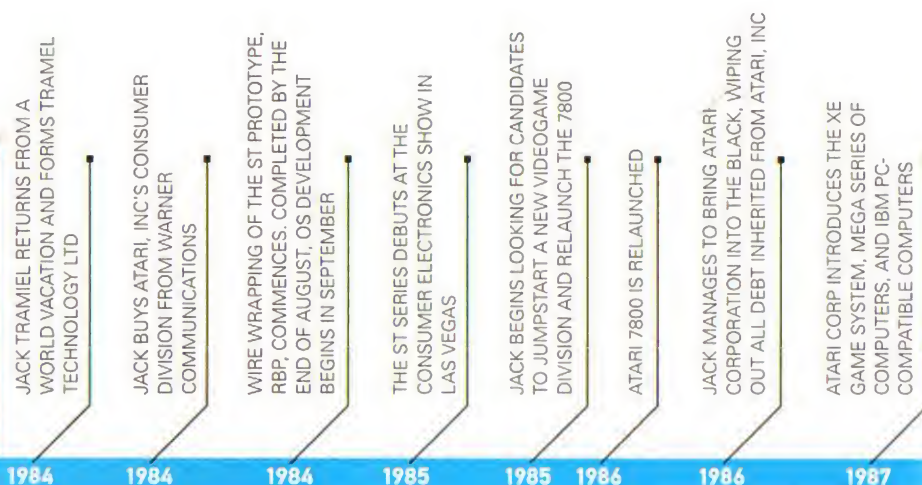

John Skrush

The last man out of Atari Corporation moved on to be a project manager at a dotcom for several years until the bubble burst. He's currently the account manager at 8x8, a cloud-based business communications firm.

THE WAY TO GO"**
MARTIN BRENNAN

TIMELINE

Atari Portfolio, the MS-DOS Tempest 2000, and various Atari calculators. Jack briefly tried to get back into the calculator business under Atari.

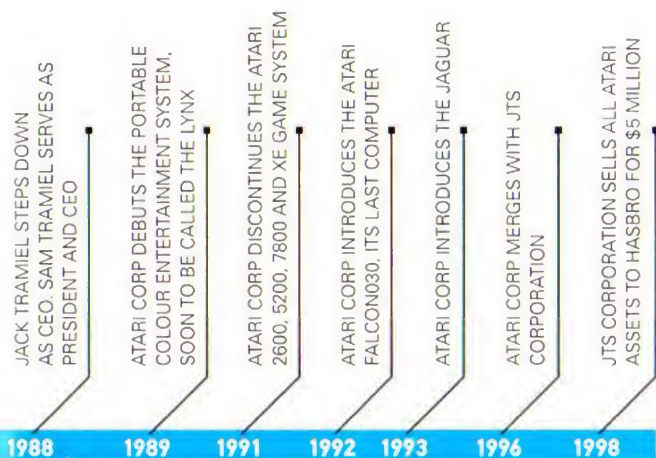

have been one of many Atari, Inc projects that faded away had Commodore not announced in July that it was purchasing Amiga and its technology. Renegotiating with Warner during the first week of August 1984 to get ownership of the original contract, Jack launched a countersuit the following week. The two companies locked horns in the courts for the next few years, with Commodore settling out of court in Atari Corp's favour. But the message sent was clear: you may have forced me from my company, but I'm not going away.

The future looks bright...

Throughout the rest of the year, Jack updated the inherited 8-bit line of computers, finishing operating system development of the new 68000-based computer – then named simply RBP (Rock Bottom Price) – slashed prices of warehouses full of console and computer inventory, and negotiated with Warner and GCC over the Atari 7800. At the January 1985 Consumer Electronics Show in Las Vegas, Jack debuted a demo model of his new computer, by this time renamed the ST and soon nicknamed the Jackintosh by the press. Alongside were the 65 and 130XE 8-bit computers and Atari, Inc mainstays like the 2600 and previously cancelled 5200. The slogan of his new ST computer line, 'power without the price', made it clear

planning out a new low-cost, high-power computer to unleash against the Japanese, Jack was visiting various companies along California's coast for possible new technology and facilities to leverage for the new computer. Amiga was one of several companies that Jack had brief flirtations with buying that ultimately went nowhere. Now here was a cancelled cheque for \$500,000 and contracts detailing a further licensing agreement that was to have been signed in June between Atari and Amiga. Instead, it appeared the money was returned with interest under the guise of Amiga not getting its custom chips to work. It would

"IN ORDER FOR A CONSOLE TO BE SUCCESSFUL IT'S ABOUT THE HOT LAUNCH TITLES"

MICHAEL KATZ

A happy Jack Tramiel just after the founding of Atari Corporation.

that Jack intended to do again what he had done with the Commodore 64: provide a powerful mid-range computer for a low-end price that undercuts everyone.

Sales of price-reduced videogame and 8-bit computer back stock generated more income throughout 1985, allowing Jack to put more into the launch of the first two computers of the ST line – the 520 and 1040ST – that summer. Unfortunately, some of those gains were made possible with a reduction in the workforce, from 2,000 employees the previous summer to 165 by June. Jack also reached an agreement with Warner to pay GCC for the 7800's development and ten launch titles.

By August of 1985 he was looking to restart his videogame division. Michael Katz was tapped from Epyx to do just that, and he changed the consumer division into the entertainment electronics division. Katz's vision was to have Atari Corporation expand to all electronic toys, not just videogames. He immediately set about getting more licences together for the relaunch of the 7800 as well as launching the delayed cost-reduced 2600, sometimes referred to as the 2600 Jr, at the magic price point of \$50.

The 7800 was relaunched at the January 1986 CES, and by April the announcement was out: Jack had done it. Atari Corporation was out of the red and in the black, and the brand was profitable again. The 7800s that had been sitting in warehouses since 1984 quickly sold out, and by the time of the June 1986 CES Atari was once again 'hot' for both computers and consoles. All was rosy, except for a Japanese company by the name of Nintendo and its Nintendo Entertainment System.

Katz had first heard of Nintendo in the US market while he was looking for arcade licences for the 7800 in November 1985, finding many of them already snatched up for the NES. But with the company having no reputation among retail channels other than a test market in New York, nothing was thought of it. By the time of the June show, however, it had expanded to Los Angeles and was growing. The fact that both Atari and Nintendo, as well as the emerging Sega, were releasing consoles was taken as a sign that the consumer

videogame market in the US was returning – and with a vengeance.

On the heels of the 'official' national 7800 launch, Atari Corporation went public with its stock, giving it the money to pay back Warner for all loans and leaving it with 48 per cent of a profitable brand.

Flying high with Atari

By 1987, operations were in full force at Atari Corporation. The 7800 was the number two console in the US, and the cost-reduced 2600 was a top-selling low-end console, which was ensuring that Atari was flush with cash. Not one to settle for anything except total market domination, Jack decided to attack the rising Nintendo with a high-end console with capabilities that would set it further apart: the ability to expand into a full computer.

"We wanted to do the 5200 done right," says Leonard. Michael Katz was of the opposite mindset: "In order for a console to be successful it's about the hot launch titles. You need a hot title for the launch. We didn't have one and I was against releasing the console, but Jack insisted on it anyway."

The XE Game System (XEGS) was released to consumers as a console with a bundled lightgun and built-in computer version of *Missile Command*. Why that particular version of the game? Because under the hood, the XEGS was powered by a 65XE computer. Driving home the fact even further was the curious distribution methods being mainly used by computer specialty stores.

On the computer front, sales were good but frustrating. Rather than investing dollars in research to significantly update the ST family's operating system (GEM and TOS), Atari Corp instead released a continuing flow of hardware revisions as new models. By 1987 Atari had released the 520ST, 520STM (with television modulator), 520STF (with a built-in floppy drive) and 520STFM (both the modulator and floppy). Likewise, it had released the 1040STF (520ST with an extra 1MB RAM and an internal floppy drive), and the 1040STFM (1040STF with TV modulator).

Added to this was Atari's entry into the workstation market, the Mega ST series, with models that represented arbitrary hardware upgrades – Mega 1, 2 and 4 simply refer to the amount of RAM in the machines. Inside, the Mega itself introduced some features that Atari ST users had been asking for: a card expansion slot and detached keyboard. There was also Atari's new Blitter graphics co-processor chip... at least for some of the models, once again causing confusion among retailers and consumers. As if to hedge his bets in this new high-end business market, Jack also had Atari Corporation start an IBM PC clone line called the Atari PC.

One lingering obstacle still remained in the way of raising sales of the ST line: the legend of Jack Tramiel. While sales of the ST range were strong in Europe, Jack's days as head of Commodore had left a bad taste in the mouths of many of the larger US retail chains, and getting into them was a challenge. Jack had been focusing on smaller specialty computer stores and made some headway in music stores thanks to the built-in MIDI support's popularity with musicians, but in a move that foreshadowed Gateway's and Apple's similar moves in the late Nineties and 2000s, Jack sought to get around the retail problem by creating his own stores. The answer was to purchase electronics chain Federated Electronics and install his second son Garry, then a VP at Atari Corporation, as its president.

Together forever

1988 became a year of transition at Atari Corporation. Jack had his overall goal accomplished – a strong company and legacy that he could leave his sons to run – so he made plans to retire from daily operations and have his son Sam take over the CEO position in addition to his current duties as president. Jack would remain involved in larger decisions as chairman of Atari Corporation's board, but otherwise Sam was in charge of everything as of that May.

Even though the distance between Atari and Nintendo in the console market had widened, Atari continued its trifecta approach of the 2600, 7800 and XEGS, releasing 45 new games for those systems.

ATARI MICROBOX

Atari was working on three different replacements for the Falcon at one point, all of which were cancelled to focus on the Jaguar: a full 32-bit version, a 68040 version, and a version called Painter that would use the Jaguar chipset. All were to fit into a new stylish workstation-oriented case called the Microbox. If the Microbox case looks familiar, it's because Sony licensed elements of the case for the PS2. How did it know about it? Many ex-Atari Corporation people wound up at Sony after the 1995 purge.

The Jaguar era art team going out for sushi.

The developers

Lynx programmers Eric Ginner and Jerome Strach at work.

However, the real important developments at the company were happening behind the scenes.

Seeing the writing on the wall, Atari began work on a replacement for the 7800 and XEGS called the Super XE, which soon morphed into a way to leverage the ST's internals for use in a 16-bit games console. Atari found that it was not alone in looking at this new market when Sega of America contacted it. Although the Master System had done well internationally, in the US it placed third behind the NES and Atari's 7800. Sega was looking to strike up a partnership with Atari by having its upcoming 16-bit Mega Drive system released in the US as an Atari-branded product. Serious talks ensued but ultimately fell apart, as Jack wanted international rights, as well as the US.

A licensing relationship with Katz's old company, Epyx, was further expanded that year to include hardware. Epyx had been having financial problems and was looking for assistance to get its Handy handheld game console to the market. The deal struck had Atari

manufacturing and distributing all the Handy units under its own name, while Epyx would provide all the software. By the time it would come to fruition in 1989 as the Atari Lynx, Epyx was going bankrupt and the entire rights to the powerful colour handheld system would move over to Atari.

While getting complete ownership of the Lynx in 1989 would position Atari at the forefront of the coming handheld console revolution, 1989 would also be the year that Atari and Jack's legacy began to unravel. The first sign was on 31 January 1989, when Atari Corporation filed a \$250 million lawsuit against Nintendo for its restrictive third-party licensing practices that locked in the most popular developers to only write games for Nintendo's platform. While not the only company to complain and go to court over the policy, it signified the beginning of an era of lawsuits launched by Atari Corporation to either change the marketplace in its favour or gain more money. It ultimately lost the Nintendo case, but by the time it was decided Nintendo had dropped the practice anyway and begun focusing on the upcoming Super Nintendo. However, Atari would later win a series of patent violations against Sega, which resulted in an influx of cash and licensing deals that brought Sega games to Atari platforms.

In February Michael Katz left, ostensibly to retire, but by the end of the year he was at Sega of America as its new CEO, positioning the freshly launched Sega Genesis to be the dominant console of the early Nineties. And as the final blow in a flurry of punches, in March Atari announced that it was selling off Federated Electronics. Jack's distribution plan had not worked, and instead the operation had siphoned off more money from Atari because it needed constant financial support to stay afloat.

Atari finally put out something more than an incremental computer update, the foremost was the introduction of the 1040STE, although some would argue that it was too little, too late. Joining the 1040STE in 1989, however, were the Atari TT and Stacy laptop. The TT jumped Atari's computer offering into 32-bit territory as a high-end workstation, retailing for almost \$3,000 when it hit the market the following year. The Stacy, while not Atari Corporation's first attempt at a portable computer, did represent its first attempt at bringing the ST into the laptop realm – or what passed for them at that time. Probably the most promising for the future of Atari Corporation in 1989 were relationships struck up with two British firms. First was Distributed Information Processing (DIP), which had managed to produce the world's first palmtop computer that was also fully compatible with MS-DOS. Licensing that and releasing it as the Atari Portfolio put the brand at the forefront of mobile computing at the time, if only for a little while.

The second relationship was with Flare Technology, a group of former Sinclair engineers who left to start their own company around developing an idea that they had for a multi-chip system that became the Flare One. By that time, the Super XE console had transformed into an advanced 32-bit system that leveraged ST technology with the short-lived Atari Transputer's graphics card. When Flare got involved, it had no sound and no name. Flare employee Martin Brennan suggested naming it after his wife's new car, the Panther Kallista, and the project received its last in a string of names: the Atari Panther. Three games were written on the unfinished platform along with some material that legendary British coder Jeff Minter had been coding, before Brennan talked Atari into abandoning the Panther for a brand new 3D platform.

"While I was over in California in '89," begins Martin, "I actually convinced the bosses at Atari that 3D was the way to go, with the experience we'd gained on Flare One – if you didn't just do flat rendering but shaded rendering, you got a 3D appearance. At the time, I was seeing pictures in magazines where computers were rendering photorealistic 3D wire meshes and I said: 'These are static images, but they only contain a very low number of polygons. We could take that, animate it and you could produce a game that was a quantum leap away from the current games.'" And so, what was to be Atari's last games console, the Jaguar, was born on the strength of a promise made in 1989.

This is the end...

Microsoft's release of Windows 3.1 in 1992 began the dominance of the 'Wintel' (Windows running on Intel hardware) platform, and suddenly Atari and Amiga found their computers being relegated to the niche markets of music and video production respectively. Atari Corporation's 8-bit consoles and computers had become amoebic in sales, to the extent that support for all of them was dropped as of 1 January 1992. Atari tried to soldier on with further updates in the ST line via the Mega STE, the STBook laptop, and its final computer, the Atari Falcon. On the market for a year, its

* [Jaguar] *Fight For Life* was created by Francois Bertrand, who worked on *Virtua Fighter*, it was panned on release.

ATARI VS COMMODORE

Probably no other aspect of Atari Corporation inspires debates to this day than the Atari/Commodore rivalry – or Atari/Amiga, that is. This is mainly due to the intertwined relationship between both companies, with Jack Tramiel being the head of both at different points in time. Unfortunately the truth is far more mundane than the exciting legends, which include stories of Jack buying Atari to get back at Commodore, Jack developing the ST in response to 'losing the Amiga', and a fanciful last-minute save when Commodore bought Amiga.

The truth is that Jack fully intended to retire after leaving Commodore, initially departing on a vacation around the world. Telling friends the only way he'd get back in was if the Japanese were coming into the market and he felt that nobody was strong enough to compete, by March those feelings got the best of him. Forming Tramiel Technology Ltd, various key Commodore personnel left to join him. By April and May, Commodore engineers like Shiraz Shivji had also left and were holed up in a nondescript hotel room in California, designing the next computer that was never based around any Amiga technology. At the time when Jack purchased Atari Consumer, development of the ST was 90 per cent done.

cancellation signified Atari leaving the computer industry altogether in favour of focusing on its Jaguar console.

Besides the limited computer sales, the Lynx was all but carrying Atari at the time. It had enjoyed decent sales, but this was the first device under Atari Corporation that could not be delivered under its 'power without the price' slogan; the colour LCD screen assured that Sam Tramiel could not drop the price of the Lynx to be competitive with Nintendo's cheaper Game Boy. To Sam's credit, though, Atari still scored some major tie-ins like *Batman Returns*, for which a 15-minute Lynx commercial played in cinemas before screenings. He also managed to get placements for the Lynx in youth-oriented TV shows like *Full House* and *Parker Lewis Can't Lose*, as well as movies such as *If Looks Could Kill* (*Teen Agent*) and *Child's Play 3*. There was the multitude of licensed ports of coin-op games by Atari Corporation's now distant cousin, Atari Games, such as *APB*, *Gauntlet* and the excellent *S.T.U.N. Runner*. However, it was becoming apparent to Atari that it needed to focus on the Jaguar, which across 1993 and 1994 was generating the bulk of the company's sales.

That promise of a 3D games console future for Atari had manifested itself in the release of the Jaguar in late 1993, a complicated multiprocessor system with a mixture of 64-bit and 32-bit graphics and sound processing, along with a venerable 16-bit 68000 chip meant for bootstrapping, all of which should have been a crowning achievement. Instead, Atari forced Flair to

rush to finish development of the custom hardware in 1991 and do product testing during 1992. The end result was some bugs in the hardware, a development manual written by Atari people who were not completely familiar with the architecture, and buggy and poorly written development software. A small internal game development budget and outrageous licensing and development fees for third-party developers made the best success repellent in the world. Many of the established publishers and studios stayed away from the platform, and those that didn't simply ignored its complex multiprocessor architecture in favour of using the 68000 as the main processor. Doing so instead of shutting it off after booting, which was the intended use, ensured that the Jaguar was limited to an expensive 16-bit machine for many games. In fact, some of the games were simply ported code from the 16-bit Genesis with graphics that fell far below the Jaguar's true capabilities.

As Atari Corporation was releasing its overdue and hyped CD unit for the Jaguar in September of 1995, it found itself in the precarious position of being sandwiched between two 'next-gen' console releases: the Sega Saturn and Sony PlayStation. Both released the previous year in Japan and were becoming runaway successes in comparison, and the Jaguar's paltry offering of games that made little use of its hardware were already looking dated next to consoles that were just getting started. Sam Tramiel downplayed the rival systems and their capabilities in an interview in *Next Generation* magazine, which is now legendary for Sam seeming to be so out of touch with the reality of Atari's position at the time.

The financial situation behind the scenes was dismal. By the end of 1995, Atari Corporation's sales declined by more than half, from \$38.7 million in 1994 to \$14.6 million in 1995. Since its introduction in 1993, Atari had only sold approximately 125,000 Jaguars – 100,000 by the end of 1994 and a paltry 25,000 for all of 1995. And as low as it was, that 25,000 represented 76 per cent of the \$14.6 million figure. In other words, the company was sinking fast because it had decided to bet everything on the Jaguar.

What also soon became apparent was that the weight of the company wasn't just on the Jaguar but almost squarely on Sam Tramiel as well. He would suffer a heart attack, which in hindsight put the *Next Generation* interview in the light of a CEO desperately trying to keep up appearances. After the heart attack, Jack came out of his retirement from daily operations and was met with a far different company to the one he'd left. Jack immediately significantly downsized the Jaguar programme in November of 1995, cancelling the cost-reduced combination of both the Jaguar and its add-on CD unit called the CoJag and a more

THE OTHER ATARI

Atari, Inc's coin division was spun off by Warner as Atari Games in 1984, and soon after it sold a controlling interest to Namco. In 1987 Hide Nakajima resigned from his board position and, with Atari Games employees, bought 20 per cent of Namco's interest, essentially leaving the company under employee control. Under Nakajima, Atari Games entered the console arena as Tengen and ended up suing Nintendo over its restrictive licensing practices.

Namco sold out completely to Warner in 1990, giving it majority ownership, with Nakajima and employees selling out their remaining shares on 11 April 1994. A few months later, the coin-op brand's beloved Nakajima passed away from lung cancer. Under Warner, Atari Games became a subsidiary of Time Warner Interactive.

In 1996 Atari Games was sold to WMS Industries subsidiary Williams Interactive, and was eventually transferred under fellow WMS subsidiary and soon to be spun off Midway Games. Midway eventually renamed Atari Games to Midway Games West before closing it down entirely on 7 February 2003.

competitive Jaguar II. Major layoffs followed that very month, as well as soon shutting down the Atari Interactive MS-DOS game-porting initiative and any other recent project efforts as well. By January he began looking for a way to sell off the company before it and the money coming in from recent lawsuits was completely gone. He eventually found the answer in the up-and-coming hard drive manufacturer JT Storage.

The merger was announced on 13 February 1996 and occurred in June when Atari Corporation reverse merged with JTS to become a division of a new company called JTS Corporation. Jack and some of the other executives would become board members of this new company, and Jack got the approval of Atari Corporation shareholders based on the promise that Atari would continue operations after the merger. However, as layoffs continued, it became obvious that Jack simply intended to keep things going in as minimal a capacity as possible. The truth couldn't have been clearer than when 1997 finally rolled around and the Atari 'division' of JTS was a solitary person, John Skruch, at a single desk. Skruch was single-handedly handling any remaining Jaguar support, the Atari website and any licensing, such as Activision's acquisition of the rights to *Asteroids* and *Battlezone* to do updates the following year.

Shareholders launched a suit against Jack that continues to this day, claiming that he misrepresented the merger. However, in the interim it would solve nothing as JTS itself was quickly falling down a huge financial pit as well. The company eventually sold off all the Atari Corporation properties and remaining warehouse stock to Hasbro on 28 February 1998 for only \$5 million. Although it was the end of the Atari brand proper, it was almost fitting that the last employee left, the one to finally turn off the lights, was Skruch, who had been an employee of both Atari Inc and Atari Corporation. An era had ended...

Special thanks to Leonard Tramiel, BJ West, John Skruch and Don Thomas.

NOLAN BUSHNELL

HE IS THE FATHER OF ELECTRONIC GAMING AND THE CO-FOUNDER OF ATARI INC. AND, DESPITE A LIFETIME ASSOCIATION WITH VIDEOGAMING, NOLAN BUSHNELL'S PASSION FOR GAMES REMAINS STRONG. DAVID CROOKES TALKS TO THE MAN WHO TOOK GAMING TO THE MASSES - AND DISCOVERS WHY HE BELIEVES SOME MODERN GAMES ARE DEGRADING....

"My vision for Atari was a company which brought technology and consumer electronics to everyday Joe and Moe," says a proud Nolan Bushnell, casting his mind back to 1972.

Back then, Nolan was aged 29 and living in Silicon Valley where he and business colleague Ted Dabney had formed Atari Inc with just \$250 dollars each.

Yet from those humble beginning grew a company which dominated the early days of videogaming - and much of that was to do with Nolan himself.

Humble beginnings

Bushnell was born in 1943 in Clearfield, Utah. Brought up as a Mormon, he has been married twice: first to Paula Nielson and secondly to current wife Nancy Nini. He has three daughters, Alissa, Britta and Neela, and five sons, Brent, Tyler, Gavin, Dylan and Wyatt. Sadly, his father died when Nolan was just 15, leaving him as the man of the house, looking out for his mother and three sisters.

His interest in electronics was sparked by a teacher called Mrs Cook who taught him electricity in the third grade. Nolan became interested in playing with science, hooking up bulbs and batteries and creating new electronic devices.

And as he went through life, he learned from many people around him: a ham radio operator who lived nearby taught him electronics and radio; a boss at the Lagoon Amusement Park in Salt Lake City, in which he worked part-time from the age of 19, gave him lessons in business; and a university lecturer at the University of Utah gave him a grounding in computer graphics. But then his interest was grabbed by a basic space combat game called *Spacewar* - and it would prove to be the

"I WANTED TO CREATE A TECHNOLOGICALLY ADVANCED COMPANY"

NOLAN BUSHNELL

Computer Space was Nolan's first attempt at creating an arcade game. It was based on *Spacewar!*

catalyst for what would later become a multi-billion pound videogame industry.

Nolan had already spent a few years during the late 1960s sneaking into the computer labs at the University of Utah to play *Spacewar*, which had been created by Steve Russell on \$7 million mainframe

PDP-1 computers at the Massachusetts Institute for Technology in 1962.

The influence is not lost of Bushnell, who juggled going to university with working at the amusement park. "The real credit for kickstarting the

videogaming industry has to lie with Steve Russell," he explains. "He was my inspiration. I thought *Spacewar* was fascinating - it was fresh and nobody had created anything like it before. From the moment I played it, I wanted to write my own programmes - the potential for videogaming was there."

Yet after leaving university in 1968, he was faced with two choices, neither of which involved videogames. He could take up a well-paid job as the amusement park manager or become an engineer with a company called Ampex, the company which invented videotape. He decided to chose the latter.

But that vision of *Spacewar* remained strong and in 1971, Nolan, along with Ted Dabney, created his own version called *Computer Space* on a cheaper, less advanced machine. "Computer Space was more complex than *Spacewar*," continues Bushnell. "As an engineer and technologist I wanted to create something impressive. It was as much about the techniques of the game as the game itself, but it had to be fun to play. You see, from a technology perspective, everything was very hard to do in the early years and, from *Computer Space* onwards, I had to develop games that could be done with the limits of the technology at the time."

Whereas *Spacewar* had been created to show off

IN BRIEF...

Nolan Bushnell's jaw drops when he plays Steve Russell's *Spacewar*, a space combat game from the 1960s. So he writes his own version, *Computer Space*, releasing it as a coin-op - but it fails. He turns his attention to simpler games and puts an idea for a bat and ball title to engineer Al Acorn - and the classic *Pong* was born. It's released by Bushnell and Ted Dabney's new firm, Atari, and is widely credited as laying the foundations for today's videogame industry.

Left: For such a basic game, it was fitting that the casing would be basic too, the word *Pong* being the only eye-catching feature. Above: Beautiful, slim and stunning - and that's just the coin-op machine. *Computer Space* was Bushnell's first attempt at an arcade game.

the power and capabilities of the PDP-1, Nolan wanted *Computer Space* to be a commercial product.

Dabney was interested and the pair joined up, selling the concept to coin-op machine manufacturer Nutting Associates in 1971. A total of 1,500 Computer Space cabinets were made in a failed venture that netted Bushnell and Dabney just \$500.

Yet the pair were undeterred and sunk the cash into a new venture. Nolan wanted to call the new firm Syzygy but the name was already taken - instead they decided

These claims were false. Nolan actually wanted to see how AI would perform as he had very little knowledge of videogames at the time and he wanted to test him.

Bushnell says: "When I devised what became *Pong* and put it to AI Alcorn, it was meant to be a training project. It was only supposed to be a throwaway game because we actually wanted to create a driving game at the time. I chose tennis because of its simplicity, yet when people say I created *Pong*, they're missing

"I DIDN'T INVENT VIDEOGAMES. THEY HAD ALREADY BEEN CREATED - THAT'S HOW I BECAME INTERESTED IN THEM. I JUST MADE THEM COMMERCIAL"

NOLAN BUSHNELL

to call their company the Japanese-sounding Atari.

"I wanted to create a technologically advanced company, one which would push boundaries," Bushnell said. "There's no question that we did this. We had a great crew and very, very smart people working for us and we were innovating all the time. One of my philosophies was to create a place where people enjoyed working. We were all interested in creating games and we liked to play what we were creating and that, I think, marked us out and made us successful. And remember, I didn't invent videogames. They had already been created - that's how I became interested in them. I just made them commercial."

Nolan created a casual work environment which threw out the rule book - there were no car parking spaces for directors and jeans were allowed in the office.

And then he employed engineer Al Acorn who had previously worked with Bushnell. His first task was to create a simple ping-pong game based on a version that had been released for the Magnavox Odyssey console.

AI went to work, having been told by Bushnell that it would be released by General Electric and that other business deals were in place.

something - AI brought a lot to the project and he made it what it was. He deserves a lot of credit for the game."

Despite its simplicity, *Pong* was addictive. And although it was a fresh concept, it was based on familiarity. Nolan realised that people would recognise instantly what they had to do. It was a departure from the complexity of *Computer Space* and it would shape Bushnell's approach to videogaming for the future.

The penny drops

"I began to quickly realise that because of the limited technology, games had to be fun, good and solid. We were the first to develop videogames so we had to make them simple, easy and quickly understood," he continues when we asked him about his approach.

"Yet this wasn't all that easy to do. I think a simple game was harder to create than a complex one because it was impossible to hide a bad game. There was no capacity for putting in nice graphics to mask bad gameplay. In a way, I consider early videogames to be like Chess was 4,000 years ago. Both contain fundamental traits which have stood the test of time, and are still adhered to today."

Contrary to popular belief, Asteroids isn't one of the games that Nolan was involved with at Atari.

Looking space-age and sophisticated, this is how Atari advertised its hits.

THIS IS A GAME?

Gaming has changed beyond recognition over the past 30 years. It's therefore difficult to make a direct comparison between Atari's *Pong* and Sega's *Virtua Tennis*, other than the basic gameplay of hitting a ball back and forth. But Nolan believes gaming has altered not just in the graphical presentation of titles, but in the way they target audiences, particularly as he believes 40 per cent of the people who played *Pong* were women.

"Unfortunately, the social and female gamer have been left out, by focusing too much on violence or sports. Games are also too complex which leaves out the casual gamer. I believe there is a huge market opportunity in targeting the casual, social or female gamer."

Yet Bushnell reckons Sony and Microsoft have been good for gaming from a technology perspective. "Technology is moving toward photo realism and the steps that have been taken have been very impressive."

But he objects strongly to games such as *Grand Theft Auto* which recently caused a stir for its sex scenes. "Controversy is a very powerful marketing tool," he says. "A year or so ago, WIRED asked me to present Videogame Of The Year to the makers of *GTA*. I declined because I don't believe that the degrading nature of the game deserves award."

Not just a game, *Pong* was a video skill game as this flyer claims.

The developers

Everyone should play *Pong* when they get a chance. It's an incredibly important game that really did shape the industry when it was released by Atari Inc in 1972. A true timeless classic that still plays brilliantly today.

Breakout was another early hit for Atari, and was another game based on a very simple, but easy-to-understand concept. It was created by Steve Wozniak who would go on to work at Apple.

Nolan tried to get *Pong* manufactured but he was repeatedly turned down. So he persuaded Andy Capp's, a local bar in Sunnyvale, California, to install a cabinet to see how well it would do.

Pong Story

After seven days, it had become jammed with quarters from eager punters. Nolan then mustered up the cash to create more machines and released *Pong* in 1972. It ended up shifting 8,000 machines, leaving Bushnell and Dabney staring at a profit of \$3.2 million.

"I'm very proud of *Pong*," admits Bushnell. "At the time I thought it was going to be good but certainly not the commercial success it was."

Two years later, Nolan developed the game for the home market and his \$99 *Pong* console was eventually

taken on by the department store, Sears. People were prepared to queue for hours to get their hands on *Pong*, which went on to sell 150,000 machines, but this grabbed the attention of other companies which had begun to create their own consoles in order to emulate the success of Atari's machine.

In October 1976 Atari became a subsidiary of Warner Communications. The company then created the Video Computer System (or Atari 2600), which was eventually released a year later in October 1977. A year later Bushnell left the company, sparking a reorganisation within Atari. Yet the company went on to release *Space Invaders* on the VCS – a game that was proving a hit in the arcades – and the console's fortunes seemed unstoppable. Just two short years later in 1978 Nolan was forced out of Atari, after it was discovered that he was holding meetings without Warner staff knowing.

Today, having recently celebrated his 69th birthday, he is still involved in videogaming.

In the years since Atari, Nolan has been involved in umpteen different companies each with varying success, among them Chuck E Cheese's Pizza Time Theaters where children could eat and play games, Androbot Inc, which created personal, entertainment robots, and Sente Games.

Bushnell was then involved with uWink, a hi-tech restaurant franchise which is based around videogames. Each outlet is packed with monitors from a two-sided touchscreen on every table to flat panels in front of every bar seat. Although the screens will show music videos and film trailers, their main use will be for games, such as card and puzzle titles, among them a variation of Pipemania. "The videogame industry has currently been doing the same thing over and over again, with little innovation or out-of-the-box thinking," he tells us about the venture.

Fast forward to today and Nolan has once again found himself back at Atari SA (which was previously known as Infogrames Entertainment) as part of the company's new board of directors. He first returned to Atari in 2010 and has been involved in a number of projects, including a search for a new iOS version of *Pong*. It would appear that Nolan's career has come full circle since co-founding Atari Inc in 1972.

BUSHNELL SAYS

Despite being intrinsically linked with the creation of *Pong*, Bushnell's favourite Atari game is actually a game called *Touch Me*, an arcade game released in 1974 that was later created as a handheld device.

"It was one of the first electronic pattern-matching type games," Bushnell explains, describing the way players had to follow a pattern of lights and sounds and replicate them to get a high score. Most people remember it as *Simon*, a version created by MB Games.

"It continues to be knocked off, and it keeps everyone from a two-year-old to a 60-year-old entertained through its simple call and response memory play. Studies have shown that games are one of the best ways for people to learn and this shows how simple concepts can be successful and educational."

Following the *Touch Me* handheld, it was envisaged that *Breakout* and *Space Invaders* would also be created as portable devices but they unfortunately failed to make it to market.

Introducing the golden touch in electronic games.

Atari! It's really the only time that's synonymous with the fun and excitement of electronic amusement.

After leading the way in arcade and home video games since the very beginning, we're really in to do great things in hand held games.

With "Touch Me!" for example. A new, pocket-size version of an Atari game that's made millions in arcades since 1972.

"Touch Me" is a brain-teasing, computerized test of memory and coordination that captivates players from 7 to 70. The variety and excitement are built in, with three different games for 1-4 players, four levels of skill, plus color and sound.

Now there's no need to take chances with manufacturers who are just getting into electronic toys. Because with Atari, you get the leading name in the field. Built-in consumer acceptance. Quality and reliability to minimize problems with returns. National advertising support. Plus the great, proven games that only Atari can deliver.

Come to the Krackbrocker showroom at the Toy Fair and see for yourself when it comes to electronics in toys, Atari has the Golden Touch.

NOLAN BUSHNELL FEATURED GAMES

COMPUTER SPACE

ARCADE

1 Regarded as the first coin-op ever released, *Computer Space* was nonetheless a flop on its release. Even though the majority were impressed by the machine, it's difficult control methods were off-putting to many.

Nolan says: "This was my tribute to Steve Russell's *Spacewar* and it had modest success. Perhaps it was too complex."

PONG

ARCADE

2 *Pong* was a game of skill that required quick reflexes and an alert mind.

Nolan says: "I wanted the simplest game I could think of and so decided that something with a bat and ball would be perfect. Programming the game so that the ball would shoot off at angles helped it to be fun and the scoring element made it competitive"

BREAKOUT

ARCADE

3 *Breakout* was Nolan Bushnell's third game. He designed the concept – basically a single-player *Pong* – and then asked a programmer called Steve Jobs to code it. Jobs set about programming the game with the help of Steve Wozniak. And Bushnell paid them \$7,000 for the work (although just \$350 was actually handed over to Wozniak).

ASTEROIDS

ARCADE

4 Contrary to popular belief Nolan wasn't involved with *Asteroids*, have already left Atari Inc, but we mention it as he's a fan. "*Asteroids* was simple and yet thrilling," he tell us. "If you look at *Asteroids* and *Breakout*, they are both about cleaning up the environment, whether it's breaking up rocks or destroying bricks. These were good, solid games."

ATARI VCS

ATARI VCS

5 Also known as the Atari 2600, this was the classic home console which no home in the late 70s and early 80s could be without. With its woodgrain finish, this was a machine for the living room, not a toy for a child's bedroom.

Atari had already dabbled in consoles, producing machines capable of playing just one game. But now the firm – and Nolan – wanted to push things further and create a machine which would play many games.

"We wanted something better than the single-game machines and so created a console which could be programmed to run many different games," says Bushnell. "Micro-processors had come down in price and made the project viable. We wanted the MOS Technology 6507 CPU which had only been created about three months earlier so it was cutting edge stuff."

"I still think this is a good console now and I'm so proud that it's still talked about today."

"THE VIDEO GAME INDUSTRY HAS CURRENTLY BEEN DOING THE SAME THING OVER AND OVER AGAIN, WITH LITTLE INNOVATION OR OUT-OF-THE-BOX THINKING"

NOLAN BUSHNELL

■ Slow to take off but when it did it dominated for years to come, the Atari VCS was the first mainstream console

ALLAN ALCORN

ALLAN ALCORN WAS THERE AT THE VERY BEGINNING OF VIDEOGAMES. HE CREATED PONG, THE ARCADE INDUSTRY'S FIRST HIT, AND HAD A PIVOTAL ROLE AT ATARI THROUGH THE SEVENTIES, WATCHING IT GROW FROM A GARAGE OPERATION TO A BILLION-DOLLAR COMPANY. PAUL DRURY GETS TO CALL HIM AL

SELECTED TIMELINE

1972: PONG
1973: SPACE RACE
1973: GOTCHA
1974: GRAN TRAK
1975: HOME PONG
1977: ATARI VCS
1980: ATARI COSMOS (UNRELEASED)
1995: ODYSSEY SLOT MACHINE
2000: ZOWIE PLAYSETS

Pong is easily Allan Alcorn's most important game.

He may be best known for creating *Pong*, but Allan 'Al' Alcorn also had a hand in many other pioneering products. As vice president of engineering at Atari, he oversaw such early successes as *Tank*, *Space Race*, *Gotcha* and *Breakout*, before helping the company move into the consumer market. His work on the ground-breaking Atari 2600 (or VCS) saw Atari become the dominant force in gaming until the industry crash of the mid-Eighties brought the whole swinging party abruptly to an end. We talk to him about wire-wraps, hot tubs and what really happened at Andy Capp's Tavern all those years ago...

We want to start by taking you back to September 1972 and Andy Capp's Tavern in Sunnyvale, California, the location of the very first *Pong* machine. Did you personally lug the thing over there?

AL ALCORN: Nolan [Bushnell] and I took it over after work, on a Monday or Tuesday I think, because the cabinet was built by Ted Dabney over the weekend. It was in a side room with about four pinball machines and I remember there was an original *Computer Space* right next to it. That prototype was a tabletop machine, with just the word *Pong* on, a coin slot and no instructions. We popped it on top of a wine barrel, bought a beer and watched what happened.

In the book *Zap! The Rise And Fall Of Atari*, there's an incredibly detailed description of how two of the regulars put in a quarter and slowly worked out how to have a rally. Then everyone in the bar had a go, people were queuing up to play it the next morning and the machine crashed that night because it was so full of quarters...

Unfortunately the guy that wrote that book [Scott Cohen in 1984] never travelled west of the Mississippi river. Many of the facts and names in that book are wrong, which is kind of sad, as it was great to have someone write about what we'd done, but the guy just based it on articles he'd read and just made stuff up.

So if that's not the truth, could you kindly tell us what really happened that night?

In the half an hour it took to drink our beers, a couple of guys came over and played the machine. They managed to play a game – it didn't need instructions, it was so obvious what you had to do. Nolan went over and said, "What do you think?" They started bullshitting right away, saying, 'Yeah we know the guys who made this.' I was thinking, 'Why don't you save the bullshit for the ladies?' I guess we were

in Silicon Valley and nothing surprised these guys. I don't think it got played again that night.

So you didn't get an extremely angry call from the bar owner the next day saying that the machine was broken?

Yeah, that's bullshit too. When we started Syzygy [Bushnell and Dabney's original company that became Atari] we had a route of about 50 pinball machines and driving games that Nolan had bought with the royalties from *Computer Space*. We had them at maybe 20 locations and I learned a lot about arcade machines from doing that route. Andy Capp's was one of our better locations. We knew the owner, Bill Gattiss, and he was very co-operative. If anything went wrong, he'd call.

"THERE WERE JUST FIVE OF US: NOLAN, ME, A SECRETARY NAMED CYNTHIA, TED AND HIS BROTHER"

ALLAN ALCORN

So there weren't people queuing up outside the next day, desperate to play *Pong*?

Actually, that was the first inkling something was weird. Bill told us that a certain set of customers turn up at nine in the morning: alcoholics drinking right after breakfast. All of a sudden, Bill said people started showing up that didn't even drink beer, just to play *Pong*. Turns out they were from another company and proceeded to make a copy of the game – Ramtron, I think they were called. It was an honest clone in that they built it themselves from our design. The other sleazy companies just copied our board to build machines; they didn't even know how it worked.

You're breaking lots of myths here. Did the coin box for *Pong* ever get so full the machine stopped working?

About a week or ten days later, I did get a call from Bill saying that the machine wasn't working. It didn't surprise me. That prototype was so poorly made, if you'd banged on it, it would've stopped working. I went down to fix it after work and some people were there waiting and were quite upset. It had gained a following, which surprised me. I opened the coin box to get a free game and saw the problem – it was packed with quarters.

FIVE TO PLAY

PONG ARCADE

1 It might not have been the first coin-op machine, but this is where the industry really began. Pong didn't so much epitomise Bushnell's mantra that games should be 'easy to learn, difficult to master', it prompted the realisation in the first place and thus introduced gaming to the masses. The graphics might be as minimal as they come, but you'll still be surprised how gripping an extended rally can be, becoming almost a battle of wills as much as dexterity. The simple gameplay was given some subtlety too, as AI split the bat into eight segments, with three vertical speeds, plus two straight shots in the middle, allowing some last-second wrist work

to send your return of serve spinning out of reach of your opponent. And of course there was that lovely hollow ringing sound when ball struck bat...

ATARI 2600 CONSOLE

2 Again, this wasn't the first home games console nor was it the first to use cartridges, but it was the one that brought electronic entertainment to millions of homes. The original vision for the VCS was simply to play *Pong*, *Tank* and a driving game, but it ended up being the dominant console platform for the next decade. AI: "One of the best things I ever did was have on the team Jay Miner, the most brilliant silicon architect of the time, Ron Milner, who'd worked on the prototype and Larry Wagner, a software guy, because I wanted us to be writing games while we were making the chip."

HOME PONG CONSOLE

3 On this side of the pond, it was probably unlikely you played *Pong* on Atari's home console, but without the technical wizardry of AI and his team which put the game on a single chip, you wouldn't have spent the Seventies playing on your Grandstand, Prinztronic or any one of the multitude of copycat systems, arguing with your mum about how this was better than watching *Opportunity Knocks* 'as a family.'

GRAN TRAK 10 ARCADE

4 Driving games had been a staple of arcades in the electro-mechanical days and this very early digital version established several features, such as checkpoints and inconveniently placed oil slicks, which would become mainstays of the genre. This first iteration only had you as a single driver racing against the clock, but *Gran Trak 20* added a second player, and *Indy 800*, released through Kee Games, increased the grid count to eight and brought colour to videogames for the first time.

GOTCHA ARCADE

5 A real oddity, and not just because it remains the only game to model its control panel on lady bumps. The pink, breast-like mouldings encased two joysticks, used to control a square in hot pursuit of a cross. One player would be the hunter, while a second would try to elude capture as they traversed an ever-changing maze. Though it offers little entertainment value today, it is arguably the first example of a maze game, if you don't count *Hunt The Wumpus*.

"PEOPLE STARTED SHOWING UP AT ANDY CAPP'S TAVERN THAT DIDN'T EVEN DRINK BEER, JUST TO PLAY PONG"

ALLAN ALCORN

How much money do you think was actually in the machine then?

About \$100. That was a surprise, too. 400 games of *Pong* [played] in a week. I told Nolan and he said, "That's interesting..."

Is that when he moment you realised that videogames were the future?

God, no! We were just a small engineering company. There were just five of us: Nolan, me, a secretary named Cynthia, Ted and his brother. The plan was to do contract work for companies like Bally, but Nolan had crazy ideas. He told me *Pong* was actually a design for a home game for General Electric, which was a lie. It was bullshit but was supposed to inspire me to work hard and make this simple, primitive game, which he didn't think was going to be any good. He was going to throw it away!

Did it bother you when you realised Nolan had lied to you?

Oh no. You have to know Nolan! I'm an engineer and this was an interesting challenge. Then Nolan wanted to make 100 a day right off the bat! We had no money, no manufacturing, there were only five of us... my wife remembers me coming home and saying, 'he's f***ing crazy!' But we grew so fast it was kind of unworlly. I was 24 years old and I'd been at Berkeley in the Sixties. This whole capitalism thing, I didn't really take it seriously. By the time I realised it was a lie, we were all too busy making these machines. I might have been pissed if it had been a flop, but we had a tiger by the tail.

You were born and raised in San Francisco. Did you wear flowers in your hair?

Throughout my high school years, I lived right near the corner of Haight Ashbury.

Wasn't that the centre of Flower Power?

I've been at the centre of all types of shit! I've had a very interesting life.

Can you remember the Sixties?

I remember Ken Kesey and the Kool Aid acid test, though I was too young to go to one. Thank God. I was involved with People's Park, which was like a student hippie commune, and I was there when they dropped tear gas on it from helicopters, which was kind of funny. There was rioting and shootings.

So did you turn on, tune in and drop out like a proper hippie?

I actually started out as a football jock. That's what helped me get into the University of California at

Berkeley. I played football for Cal for one week. It was either be a football player or an electrical engineer and I chose the latter.

Was that a tough choice?

Oh, I was always a nerd. I fixed televisions from the age of 12. I worked my way through college fixing TVs for repair shops. I always wanted to be an electrical engineer... whatever that was.

So did you end up playing *Space War* in the computer labs all night?

No... we had mainframes at Cal but you couldn't touch them! Nolan had graduated from Utah, which in the Sixties was one of only places to have a PDP-1. He saw *Space War* on that machine and he had also worked at an amusement park in Utah in the summer. He started to connect the dots... how can we translate a game on a million-dollar computer to the arcade?

You actually met Nolan Bushnell at Ampex. How did you end up working there?

I landed this great job in my third year at Cal: six months at Ampex and six months in school. The plan was to make enough money to pay my way through college. Did I? No, I pissed it away on beer and women. I still had the TV repair job though, so it was fine.

So what were your first impressions of Nolan when you met him?

He was an engaging, talkative guy. He didn't impress me as a great engineer but he was an entrepreneur. I mean, in the late Sixties, he set up a club to buy and sell stock at a time when you had to be a rich man and know somebody to buy stock. He started to work on this game Computer Space in the evenings and he left Ampex to join Nutting Associates. We thought he'd made a terrible mistake. If you got a job at Ampex, you worked there for life. You got

your gold watch! To throw that away and go and do something called videogames... the president of Ampex, Charlie Steinberg, even called Nolan in and told him he was making a big mistake.

So when Nolan and Ted Dabney asked you to leave Ampex and join them at Syzygy, surely you were making the same big mistake?

I was young and thought, 'Gee, this is crazy,' but I thought if I join a little company, I'll have to learn about the entire process, not just engineering – buying, manufacturing, hiring and all that stuff. I figured it would fail in a year or two and then I'd come back to Ampex. What the hell? This was the Sixties, we had the Cold War... live life!

When you began at Syzygy, we've read that Nolan first suggested doing a driving game. Is that correct?

I think that was made up. *Computer Space* was reasonably successful but not a big splash. Nolan thought the winning game might be something more complex, maybe like a driving game. But once *Pong* took off, he realised maybe the games don't have to be more complex, they need to be simple and pleasing. That's where the sweet spot is!

So how did Nolan actually describe the game that became *Pong* to you? Did he give you a detailed design document?

Oh no, it was just a very general goal. Let's create a ping pong game on a TV screen where you're looking down on it. One spot that moves, two paddles... just to get that on the screen with the limited technology we had was pretty exciting for me.

It's been well documented that Nolan Bushnell visited the Magnavox Profit Caravan in May 1972 and saw Ralph Baer's tennis game playing. Were you aware that that was what he was basing his description on?

What people don't realise is, you know that movie *The Producers* by Mel Brooks? This was just like that! He picked a game that he thought was a dog but was very simple. He was going to throw it away! Copying someone else's game isn't a problem if you're never going to sell it, right? Well guess what? It became a f***ing hit, just like in the movie!

So *Pong* was like *Springtime For Hitler*? Did Magnavox see the funny side?

We got this letter from them pointing out patents and we're like, 'What? That's bullshit!' But in the end we got a paid-up licence... everyone else had to instead pay royalties.

In retrospect, *Pong* seems an incredibly simple game, but when you were creating it, did you actually agonise over the size of bat, the speed of ball, the angle of the bounce and other small details?

[laughs] Nolan had just said a ping pong game, that's all. In the first version I got working, the ball only went at one speed and that wasn't much fun. So I talked to Nolan and Ted and built a circuit that made the ball speed up and, hey, this is more fun! It evolved. As for ball size and stuff, everything was based on expediency – whatever worked! Remember, I was

« He may be semi-retired now, but Al's working with three fellow veterans on "something in a new area" »

“MY ATTITUDE WAS: I DON'T WANT TO DO SOMETHING IF IT'S BEEN DONE BEFORE. WHERE'S THE FUN IN THAT?”

ALLAN ALCORN

trying to make something simple and Nolan had told me it was for a home game so keeping costs down was primary. Like, the paddle didn't go to the top of the screen, which was a design flaw, but I soon realised that was critically important because a good player could always win eventually by getting it over the top of the other guy's bat. If I hadn't put that in accidentally, the game would've been a failure because people could have played it forever. My motto was: if you can't fix something, call it a feature!

You sound like Bill Gates...

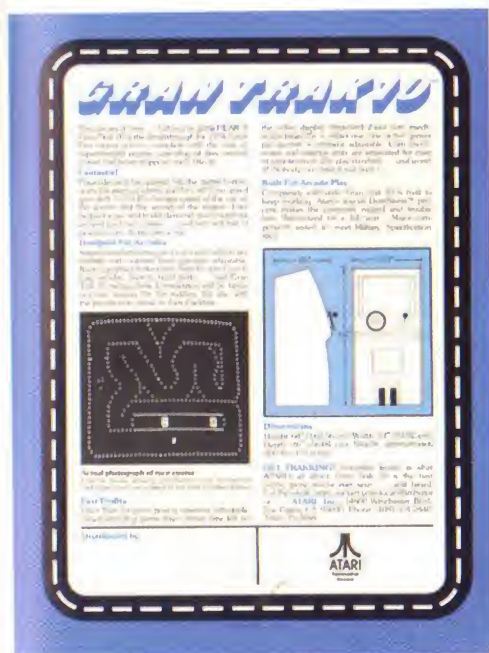

I taught him everything he knows!

Atari ended up releasing a string of *Pong* sequels after *Pong*'s success – *Pong Doubles*, *Quadrapong*, *Puppy Pong*, *Spike* (which was essentially *Pong* on its side)... the modern games industry gets a lot of criticism for flooding the market with endless sequels, but didn't you start all that?

[laughs] Yes we did, but we tried not to! It was what the customers wanted. The second game I designed, *Space Race*, didn't do very well and the third, *Gotcha*, which was a precursor to *Pac-Man* – those were done before *Pong Doubles*. Doing a four-player *Pong* was technically uninteresting to me so I hired someone else to do it. I get bored easily!

You even put *Pong* in a barrel didn't you?

Yeah. They were actually old wine barrels. And smelt like it.

An early flyer for Al's *Gran Track 10*.

Atari was not above using various props and actors to make their games look exciting.

There are also sorts of variations of Pong and many of them are now becoming quite rare.

Were there any other weird places you contemplated putting that Pong board in?

Nolan was full of them! Jesus Christ! You've seen *Breakout*, right? That was just another variation on Pong. Nolan convinced Steve Jobs and Steve Wozniak to do that behind my back because I didn't want to do it.

As well as all the versions of Pong produced by Atari, there were a slew of copycat games from other companies. How annoying was that to you?

Very! My recollection, which is different to Nolan's, is we only shipped 3,000 Pong machines, but there were 10 or 20,000 made. That was money we should've earned. But we had something that the copiers didn't: the next game.

One of the results of all this new competition was Ted Dabney sold his share of the company to Nolan and left. How did that make you feel?

Oh boy. Atari was in a period of rapid growth, it was out of control, and we all had to adapt and do new things. We had all been engineers at Ampex and had been very protected in our little boxes and suddenly we had to get into manufacturing, materials, shipping... it just wasn't Ted's thing. Ted was a dear friend and it broke my heart that it didn't work out.

Earlier you mentioned *Gotcha*. Was getting a maze up on screen a challenge?

Gotcha was inspired by a defective Pong circuit board. You had 70 or so chips and typically you would have one or two bad ones every time you built a

"AT FIRST WE JUST THOUGHT 'MY GOD, WE'VE GOT A WHOLE GAME ON A SINGLE CHIP AND ISN'T THAT COOL?'"

ALLAN ALCORN

board. The score circuit on one screwed up and there were these segments all over the screen. We were like, 'Hey look at that, we could use that!'

And what exactly inspired the controller setup on that game, which closely resembles part of the female anatomy?

The boobs were the idea of George Fracco, a guy we hired to make our machines look more interesting. We only made about ten with controllers that looked like breasts. Real collectors' items.

Was it true that Nolan asked you to produce a 20-player version of *Gotcha* by linking up multiple cabinets?

He was gushing with ideas. It was hard as an engineer to keep up! It was planned but never built.

Despite the early success with Pong and its various offshoots, by 1974 Atari seemed to have been in a real mess, with huge debts and staff layoffs. How did that come about and what were your thoughts on it?

It was kind of complex. We had started our own competition with Kee Games and that was well run by Joe Keenan. We gave him our designs and Steve Bristow, one of our best engineering guys, and they did a pretty good job.

We'd bitch to the distributors about Kee, 'Those bastards stole our designs; they stole our engineers' and they loved it! They would run right down the road and talk to Kee Games about us! That was why it was so much fun working with Nolan. We would even play games with our own customers.

Creating a supposed rival in Kee Games so you could get around exclusivity deals with distributors was a very clever idea at the time. Why, then, did Atari eventually end up being on the brink of ruin?

Nolan had read this book about growing companies and the thesis was that the people you use to start a company are not the same people you use to grow the company when it gets over a million dollars. We'd made over a million in the first year so he set about hiring people to replace me and the VPs of finance, marketing and manufacturing. He hired people with no experience of coin-op or innovation. Like, he hired a Christian psychiatrist as the president. Very strange. Long story short: it was a disaster. They ruined everything and Atari almost tanked.

So Nolan actually replaced you? You must have been livid.

Well, at the same time my mother was dying of cancer, so it meant I could be with her for the three months when all this was happening. She passed

away and shortly afterwards I got a call from Ron Gordon, our marketing guy, saying, "Get back here, goddammit!"

What did you find on your return?

The banks had stopped loaning us money, our suppliers were cutting us off... Nolan broke down in tears, which I'd never seen before. We went out to a restaurant together and Ron got busy bringing the right people back and merging us with Kee Games. Joe became president of Atari and I was back as VP of engineering.

And did you find any games ready to ship?

Gran Trak was ready to go but it had been engineered by my predecessor who'd done such a terrible job it simply wouldn't work on location. My first job back at Atari was to redesign the game so it could be built. And it was a hit!

The success of *Gran Trak* and then *Tank*, which Lyle Rains and Steve Bristow had worked on at Kee Games, put your coin-op division back on track. Was this when you decided to try to move into the consumer market? Is that when you felt a change was needed?

I have a memo from Nolan dated August 1973 listing a bunch of stuff I had to do. Item six is home *Pong*. Basically, the consumer videogame industry is number six on the list! And it interested me. Back then no one made custom chips. I thought, 'I wonder how far I can take this?'

So decided to team up with Bob Brown and Harold Lee...

What a tag team they were. We three designed this chip, AMI manufactured it and when it came back, the damn thing worked! We had no business plan or any idea how many we were going to build. I really hadn't thought the thing was going to work. It was like when a dog chases a car: what does he do when he catches it? We looked at each other and said, 'Holy shit, what do we do now?' Back then no one in Silicon Valley did consumer products. We called Sears and Roebuck and they were incredibly helpful, especially Tom Quinn. It never would've got done without him.

So did things then started to go relatively smoothly from then on?

Oh God, no. There were so many hurdles to getting home *Pong* done. Like, we were demoing it to the executive board in Sears Tower on one of their colour TVs. I had this wire-wrap prototype, two big planes with about 200 ICs on them, in a wooden box. It didn't work and then I realised I was using Channel 3 and they broadcast the signal for Channel 3 from the top of the building I was in! I had to open this thing up and retune it in front of all these vice presidents, but we got it to work.

You seem to have been making it up as you went along...

Oh, we had no idea what we were doing. Like with pricing, Nolan just pulled a number out of his ass and it worked. Sears were incredibly supportive and wanted us to just sell it to them but we thought, 'No let's take it to the Toy Fair in New York City'. We didn't realise

that the buyers had already done all the deals before the show, so we sat in a booth with this f***ing *Pong* machine, which we thought was going to be the hit of the decade, and none of the buyers from all the big retailers showed any interest at all. That business is very staid, very conservative and very stupid.

Thanks to Sears' faith in you, home *Pong* was the must-have toy of 1975 and Atari made \$39m in sales that year. Was it all fast cars and loose women? You can tell us.

I deny the allegation and I defy the alligators! We had a lot of fun and we made a lot of great products. Other people had more fun with the ladies than me. We didn't take ourselves too seriously and I think we changed the way people in the Valley behaved. We didn't wear suits and ties, which was unheard of at that time. I mean, Steve Jobs worked for me and he didn't wear shoes. He didn't bathe much either...

Talking of bathing, did you spend much time in the infamous Atari hot tub?

We knew our assets were our engineers and we wanted to treat them well because if we lost them, they were hard to replace. We had a work-out room, but people were afraid to use it because, back then, you didn't sit in a hot tub in the middle of the working day. So one day, Nolan and some of us went over there, took off our clothes and jumped in. We were drinking wine and partying and others joined us, including some ladies. I remember a young employee who'd just started there was giving his parents a tour and he pointed to the hot tub and said, "There's the chairman of the board, there's the VP of engineering..."

It's an interesting management strategy...

Our attitude was, look we all have stock in the company, here are our goals, let's work very hard to achieve them but I managed by objective. I didn't say you had to be there at 8am. If you never showed up

BY THE NUMBERS

AI was employee number 3 at Atari

The number of points required to win a game of arcade *Pong* is 11. In the home version it's 15

The number of simultaneous players in *Gran Trak 10* is 1. The number of simultaneous players in *Gran Trak 20* is 2. See what it did there?

The launch price of Atari's home *Pong*, marketed through Sears' Tele-Games label, was \$98.95, a number AI says that Nolan Bushnell 'pulled out his ass'

Upwards of 26 million VCS consoles were sold during its long lifespan

The number of games built in to Alcorn's Cosmos handheld console was 8

\$39 million: Atari's revenue in 1975

\$1.1 billion: Atari's revenue in 1983

\$539 million: the losses posted by Atari in the same year

A flyer produced for the unreleased Cosmos holographic console, the great granddaddy of the 3DS.

"OH BOY. ATARI WAS IN A PERIOD OF RAPID GROWTH, IT WAS OUT OF CONTROL, AND WE ALL HAD TO ADAPT AND DO NEW THINGS"

ALLAN ALORN

Space Race was released the year after *Pong* but failed to replicate its success

and still got the job done, great! Tell me how you did it, I'd like to pull that off too! We'd work all day and night when we had to, but we made time for parties and special events.

As part of the deal Atari had with Magnavox over licensing Pong, weren't you supposed to share this sort of thing with it?

Nolan had signed a deal with Magnavox a week before the CES in June 1976 that said we had to share any technology we had with them for the next 365 days. That meant we had to keep the VCS a secret and that was one of the hardest things we ever did. We could not keep secrets! That was one of the only times we managed it and it worked to our advantage because we turned up to the June '77 show with this product that blew everyone away. No one saw it coming. I mean, others like Fairchild had cartridge-based games, but this was by far and away the best. We took all the engineers along to share in that moment.

This was around the time that Warner bought Atari. How did that affect things for you?

At first it was great – we had loads of money and could fly round in jets! The VCS did well the first year and okay the next but wasn't meeting targets. Nolan's and my solution was to design new products but Warner was a marketing house and they said, 'No we're going to advertise this.' And they were right. They marketed the snot out of it and it took off. But that wasn't interesting to me. Making lots of money is fun but it doesn't make you go to work every day. The consumer division had become kind

“THAT WASN'T INTERESTING TO ME. MAKING LOTS OF MONEY IS FUN BUT IT DOESN'T MAKE YOU GO TO WORK EVERY DAY”

ALLAN ALCORN

of boring to me. Nolan had gone and the Warner guys that replaced him had no idea what to do and the process the management had put in to figure it out was [not very good]. I wanted a new challenge so went off to try to create a game using holography.

Ah, you're talking about the Cosmos. How did you dream that up?

You know I said we couldn't keep secrets? Well, instead we put out disinformation so our enemies couldn't tell which was real and which was bullshit. One of the big bullshit things we put out there was that we were going to use holography in a videogame. It seemed kind of weird and space age enough so that it might happen and it distracted them. Once Nolan was gone I thought, 'Hey I wonder if I really could make a game out of holography?'

So you believed your own bullshit?

Yeah, exactly! It was a challenge. My attitude was: I don't want to do something if it's been done before. Where's the fun in that? I put together a neat team hidden away in engineering away from the corporate nonsense.

Tell us about the Cosmos.

Management had said, if you could make a videogame system with cartridges half the price of VCS ones, that would be great. They only have one chip, so I thought how can you cut cost? The answer: no chip! We put a very cheap, embossed hologram in there instead.

That's really clever. Were the games good?

Well, not really, but it might have been interesting. The quality was like those little handheld baseball games you got back then, but played over these holographic images. We had an array of LEDs, about 8x9, controlled by a cheap microprocessor, and you had some buttons on the front panel. You put the cart in which had a 4x5-inch hologram and buttons on the cartridge that would tell the motherboard what game to play. All the games were stored in the ROM of the machine itself, not the cartridge. One of two light bulbs inside the base unit would light up in just the right spot to make this 3D image appear. So you'd be playing a space race game over a moon surface and if you crashed another image would appear with this wrecked spaceship.

Sounds fascinating. Why did the machine never go into production?

We took the prototype and Space Boost to CES in January 1980 and got orders for 250,000. I think it was that many; I may have been drunk. Warner wouldn't market it, though. The huge success of the

VCS, which was making like a billion dollars a year, meant we could put a product out and if it failed it didn't matter financially... but, emotionally, they were so afraid to put something out that might fail and the bad publicity, they wouldn't release anything new. It's endemic to big companies. The success of their products stifles anything new.

So that's why you left Atari?

I walked away from millions of dollars. If I'd stayed there and shut up and looked pretty I would've made millions in bonuses but I couldn't stand it. That's a problem I have.

But you didn't leave the games industry behind just yet, did you?

I went off with Nolan and founded a company called Cumma. The problem in those days was there were billions of cartridges and a retailer didn't know what to put on the shelves, what will sell, and if he bought a bunch of games that didn't sell he was stuck with them. Nolan and I had this clever idea to make cartridges with static RAM so you could download a game onto them and when you were tired of it, you could put a new game on it. Way ahead of its time. We had a special unit that could make carts for the VCS, the Colecovision and any of the other machines out at the time. We got the thing introduced in 1983 and the market blew up – you couldn't give away a videogame. That party was over...

Since the videogames crash in the mid-Eighties, you've worked at Apple, helping to invent the mpeg format and QuickTime, you've produced interactive toys at Zowie, created a media-rich slot machine for Las Vegas at Silicon Gaming and worked with lots of start-up companies. You seem to like things at the beginning, when they're still small.

I like puppies but I don't like dogs! [laughs] In the Valley, you can choose to work with big or small companies and I work better in a small environment. Plus, I like new challenges. I'm semi-retired now but I'm still working with three other old-timers on something in a new area for me and I just got back from a conference at Stanford on hot chips. I'm trying to keep current!

Given you were right there at the start of the videogames industry and created the games that got Atari off the ground, do you ever feel your contribution is overlooked? Nolan does tend to get all the attention...

Not at all. Nolan deserves all the credit. More than he already gets, in fact. You know I said I used to come home and tell my wife he's f***ing crazy, he wants to build a hundred machines a day? I never would have done any of it without him. Sure, I was the engineer, but frankly there were others that could have done the job – maybe better, maybe worse. I was crazy enough to go along with the gag. I was at the right place at the right time, at Berkeley and at Ampex, to have these things happen. And I got my rewards. Nolan and I are great friends and I get plenty of respect from people like yourself asking me questions. Most engineers work their whole life on stuff and are anonymous. I'm lucky enough to have done something that touched so many lives.

Atari had sold 100 or so machines already, but this was its very first advert for Pong, placed in Playmeter magazine in early 1973.

Pong prepares to go public with (from left) Ted Dabney, Nolan Bushnell, Fred Marenchek and Al.

The original Pong prototype. The name was simply half of ping pong, not connected to the sound of ball striking bat.

MORE FROM ALLAN ALCORN

THERE ARE PLENTY OF OTHER QUESTIONS WE WANTED TO ASK ALLAN, HERE ARE SOME HE ANSWERED...

■ Did you work on any abandoned projects?

Apart from Cosmos, let me think... ah yes, Video Music! [laughs] Harold Lee, who was kind of a hippie, Hell's Angel type who rode Harleys and Bob Brown, who was the straightest guy who ever worked at Atari, had this idea to build a product that connected your TV set to your stereo. You'd put the set on and see this dazzling light show. We kept Harold away from the Sears guy, Tom Quinn, who wore a suit and was a real businessman. Atari was hard enough for them to take without showing them the crazies in the backroom, but once home Pong had been a success, we were a bit more relaxed and Harold and Bob thought they had a great idea. So we got this set up in the lab with a big TV, stereo blasting out Iron Butterfly and this light show going on.

Tom looks stunned and says, "This looks like the kind of thing hippies would sit around and smoke pot". Harold goes, "EXACTLY!" and pulls a joint out his pocket and offers it Tom. That kind of ended the discussion. We released the product at the Consumer Electronics Show in January 1977 and we didn't sell any! Ask any engineer from back then and they'll have a Video Music, boxed, in their closet.

■ Did you ever play someone at Pong who didn't know who you were?
I was just at California Extreme

and this ten-year-old was playing an original machine by himself. So I went over and said, I'll play it with you. I beat him, beat him real good and I said, 'You know, I used to be the best Pong player in the whole world.' He looked at me like I was crazy. He didn't know I designed it and was the only player for a while.

■ Did you create the paddle controller for Pong?

Yeah it was just a simple potentiometer. I bought a cheap one for the prototype and after we'd had the problem with the coin box filling up, the next thing that went was the potentiometer, within a few weeks. I thought this was crazy, then I did the math; for every quarter the machine took, you turn that knob 20 or 30 times. Multiply that out, this thing was getting tens of thousands of turns per week. I wound up having to buy a very expensive premier potentiometer from a military contractor so it would last.

■ So what do you think of the Wii U?

I like all the stuff Nintendo have been doing, with the Wii and the 3DS. Yeah, it did make me think of the Cosmos and I smiled! It's great to see that creativity and risk taking. I've just learned about the new chipset for the Microsoft games machines. You know what it does? Exactly

the same as the previous one but cheaper. Not one f***ing new idea. Come on guys...

NAME: HOWARD SCOTT WARSHAW

DATE OF BIRTH: 30.7.57

FIRST JOB: SHORT ORDER COOK

CURRENTLY: EXECUTIVE PRODUCER, SCOTT WEST PRODUCTIONS

FAVOURITE FILM: DR STRANGELOVE

YOU MUST PLAY...

Raiders Of The Lost Ark

Howard's neglected middle child and something of a lost gem. *Raiders* continually surprises – hidden areas, multiple routes through the game and an ingenious use of both joysticks to manipulate movement and inventory simultaneously. It's full of lovely little touches: Indy's death throes, which leave only his hat remaining; parachuting into trees to investigate that intriguing hole you've plummeted past so often; Yar making an unexpected cameo.

"Actually, my motivation comes from your country," explains Howard, who even greets us with a particularly well-researched 'ey up mi duck'. "I've always tried to follow Monty Python's advice – Now for something completely different..."

It was a creed he applied consistently in his approach to game design. "I need a reason each time I do a game – something that makes me feel like it's really worth doing. With *Yars' Revenge*, I wanted my first game to make a big splash on the screen and break new ground in the gaming world. With *Raiders Of The Lost Ark*, one of the first movie licences, I was trying to make the biggest adventure game there'd ever been on the VCS. With *ET*... well, *ET* was about getting a f*cking game done in five weeks!"

The E.T. saga

Ah yes, *ET*. 'The Worst Game Ever Made'™. A game so malignant, millions of unsold cartridges had to be buried in the desert beneath concrete, yet it still caused the collapse of the industry from beyond the grave. A game everyone has heard of, few have played and a game that truly qualifies for 'urban legend' status.

"It's a compelling myth," Howard chuckles. "No one's ever retrieved a piece of *ET* from the desert and it would have required a conspiracy of Kennedy Assassination proportions to have kept it a secret for so long. The game still sold a million and people still talk about it 25 years later. And to think I single-handedly toppled a billion dollar industry just cracks me up..."

It was an industry the young Howard didn't really seem destined for. He'd consciously avoided computers during his schooldays in New Jersey and it wasn't until his Economics degree that he rather reluctantly took a computer class. He became smitten overnight, voraciously consuming the entire semester's work

» *E.T. The Extra-Terrestrial* was a massive flop for Atari and remains the stuff of urban legends.

in days. Hungry for more, he took a job at Hewlett Packard after leaving college, only to discover the grim reality of cube life. Rather than going quietly insane with boredom, Howard decided to do it loudly and with gusto. His outlandish behaviour caught the attention of one co-worker who knew of a place where eccentricity was the norm...

"I went to Atari for an interview and immediately I knew it was the place for me," Howard tells us. "[It was] relaxed, creative, fun and the technical side was really interesting. But they turned me down for being too straight! Maybe it was my formal educational background and my time at HP. Or perhaps it was the herring-bone tweed jacket with leather elbow patches, but hey, I was wearing sandals!"

Much pleading and a 25 per cent pay cut later, Howard persuaded Atari to give him a chance. He also convinced them that the project he had been assigned – a conversion of the arcade game *Star Castle* – would 'stink' but he could take the game elements and come up with something good. The resulting *Yars' Revenge* boldly announced Howard's arrival on the screen.

"I wanted to fill the senses," he enthuses, clearly proud of the game that cemented its place in history as the biggest-selling original title for the VCS. "I wanted players immersed and to really feel when something happens in the game. So there's a death sequence, a victory animation, a full screen explosion, lots of colour and glitter."

The game deftly combined innovation with immediacy, and had some clever technical touches (the eye-catching Ion Zone was created using the raw game code itself to randomise the graphics and colour registers and you'll also find the initials HSW hidden away as an Easter Egg) and proved especially appealing to female players. "I think it may have something to do with the oral component," muses Howard, with hopefully only his tongue in his cheek. "Like *Pac-Man*, you nibble and you run away. The more you eat, the closer you get to danger..."

For his next project, the theatrical Howard took the concept of method-acting to its logical conclusion – method programming. He donned Indiana Jones' trademark hat and would roam the corridors of Atari HQ cracking a ten-foot bullwhip at terrified marketing suits. "I said the whip was for R&D – Research and Discipline. I would try anything to increase my immersion in the character and help make the game better."

Raiders Of The Lost Ark became his greatest production. Howard crammed in 13 distinct locations

Howard was initially considered too straight for Atari. Okaaaay...

Howard's first release came with a comic he penned to explain the elaborate back-story.

into the limited memory of the 2600 and populated them with slithering snakes, black market sheiks and a wealth of fiendish puzzles. Amongst the array of assailants facing the intrepid adventurer is a 'raving lunatic' – was this perhaps an indication of Howard's mental state at attempting such a grand endeavour on the humble VCS?

"No anthropomorphism there," he assures us when we ask him. "Though that was kind of how I felt four weeks in to ET..."

Successfully converting a Spielberg blockbuster into game form was indeed a double-edged sword. When Atari management decreed ET must be released in time for Christmas 1982, cutting the typical development period of six months down to a miniscule five weeks, Howard's standing with Spielberg and his love of a challenge meant he stepped up to the plate. It was a colossal effort, which involved virtually continuous coding and a mountain of marijuana, but Howard delivered. Sort of.

"I submitted a complete, non-trivial game on time, so in that sense it was a success. Many didn't enjoy playing it; so on that level it was a failure. It sold well over a million – a success! It needed to sell seven million to make money – a failure! Ah, it's all relative..."

The hardware master

What ET did demonstrate was Howard's increasing mastery of the hardware. He returned to the frenetic action of Yars' and through ingenious vertical separation, managed to display a multitude of character sprites simultaneously on-screen. Saboteur was an original, multi-directional shooter and was 95 per cent complete, when Atari acquired the A-Team licence and approached Howard with a plan.

"I thought what the hell – let's put a giant Mr T head in there! I began reworking the graphics and some of the gameplay, but then Atari imploded, the Tramiel's came in and that was the end of game development."

Howard did meet with crazy fool Jack Tramiel to discuss game ideas. However, when the new boss seemed more concerned that Howard's wife had a job rather than waiting at home with his slippers ready, he knew it was time to move on. It wasn't quite the end for Saboteur though, which finally appeared on the Atari Flashback Plug and Play joystick released last year.

For the next decade and a half, Howard turned his

creative talents to everything from videography to industrial robotics, but was finally lured back to the games industry and joined 3DO at the end of Nineties.

"What a reality crash! Games used to be about finding something innovative and fresh and now it had become a risk minimisation exercise. Trip Hawkins, the CEO, had assembled possibly the greatest collection of talent in game history – wonderfully creative people like Rob Zdybel, Bill Budge, folks from Atari coin-op, Magnavox and Mattel – and then imposed ludicrous deadlines and provided no budget. To hear him stand up and say, 'With another two weeks, are you really going to make a better game? Will it offset the two weeks of sales we've missed out on?' It just felt like everything I'd loved about the industry had been killed."

The bitter experience was further compounded when 3DO closed its doors abruptly, leaving Howard and many others unemployed and owed thousands in unpaid wages. His disillusionment with the state of the industry gave an added poignancy to his first major work as a documentary maker, as he set about telling the tale of when things at the company were both very different and ominously familiar...

"Atari was really the biggest thing in my life and it affected me in myriad ways. I wanted to make a film that told it from the perspective of those that had actually been working there. Lots of bullshit had been written, trying to sensationalise, but the truth is always more interesting. I needed to make the film, to make my peace with my own experience there."

Once Upon Atari, was produced in four parts and now available on a single DVD from www.

A Retro Gamer exclusive – Jerome Domurat's never previously published concept art for Raiders Of The Lost Ark.

MY DIRECTOR IS AN ALIEN

Howard travelled to Los Angeles to meet Steven Spielberg while programming Raiders Of The Lost Ark and decided to break the ice with a typical conversation starter.

"I told him I had a theory that he was an alien. I figured that contact with aliens was imminent and they were smart enough not to just show up at the door. They needed to 'prepare' the earth, so they send an advance team. You see, with Close Encounters and E.T., it was really the first time aliens had been presented positively – friendly figures, not monsters."

The flyer knocked up by piss-taking colleagues to commemorate a true meeting of minds...

ONCE UPON ATARI

Howard's entertaining and revealing documentary on the Atari story features interviews with such alumni as Todd Frye, Rob Fulop and graphic artist Jerome Domurat, who collaborated with Howard on *Raiders*, *ET* and *Saboteur*. It's a fascinating mixture of crazy anecdotes and exasperated accounts of how the marketing department installed after the Warner takeover at best misunderstood the whole process of game development and at worst, openly despised the programmers. The resulting rift was a major factor in the company's spectacular collapse. Would things have been different if Atari founder Nolan Bushnell had stayed at the helm?

"That's an excellent point and yeah I think it could have been different," agrees Howard. "The people that came in after Nolan were 'org chart' people, who just saw programmers as the line workers at the bottom of the chain."

» Atari founder Nolan Bushnell in the *Once Upon Atari* documentary. Rolled 20-dollar note just out of shot.

"WHEN I WAS DOING RAIDERS, I'D CARRY A TEN FOOT BULLWHIP AROUND. I SAID IT WAS FOR R&D – RESEARCH AND DISCIPLINE."

HOWARD SCOTT WARSHAW

onceuponatari.com, paints a vivid picture of the company during its creative blossoming and subsequent chaotic demise. Told through frank and often-hilarious interviews with all the key players, it easily demonstrates Howard's determination to get to the truth by giving a voice to those who have been previously maligned and misunderstood by others.

A similar motivation runs through his most recent production, as *Vice And Consent* (www.viceandconsent.com) seeks to present the BDSM community (the acronym stands for Bondage and discipline, Domination and submission, Sadism and Masochism, but you knew that...) in an honest, non-judgemental light. Is there perhaps a parallel between these two apparently disparate subcultures?

"You could argue videogames are safe fantasies, like the BDSM world. And if you want to talk about a group of people willing to put themselves through extreme pain, torture and hardship, that sounds like game development to me..."

The agony and ecstasy of hacking out code on the 2600 may not quite be a thing of the past for Howard

either, as he casually mentions he still has the design for *Yars' 2* up his sleeve. Whether he ever spoils us with a long-awaited sequel or continues to charm us with his wit and erudition in any number of creative fields, one will be watching expectantly. He had us at Atari.

» Relive the sights, sounds and, yes, smells of life at Atari...

» *Saboteur*, before Mr T entered the picture and refused to get on no plane

HOWARD SCOTT WARSHAW'S FAVOURITE VIDEOGAMES

QIX ARCADE

1 A great game that really demonstrated out-of-the-box thinking. An interesting application of geometry and space management. Most games were shoot and avoid, but this was about carving out a space. There was a safe time and a dangerous time. It had a really different approach and illustrated that you don't have to think traditionally about what makes a game.

JAK AND DAXTER PS2

2 Beautiful, fun and compelling. On a sensual level, it's a spectacular achievement and really pushed the capabilities of the machine. And I never got tired of the music either. Doing that with a repetitive theme that you're going to listen to for 30 or 40 hours is really quite something.

MILLIPEDE ARCADE

3 Lots of visceral action, lots of things happening everywhere and so well tuned. You can go for the quick win if you shoot the DDT and wipe out a whole millipede or if it gets all broken up and down at your level, you have that frenetic recovery element of cleaning up your mess and getting out of a tight spot. Both really gratifying.

DEFENDER ARCADE

4 The first perfect videogame. Asteroids and Space Invaders were huge, but were uni-dimensional. This was the first multi-dimensional game. There were more threats and objectives than just cleaning up your plate. There were styles of play. It was the first game to really generate meta-conversations – people would talk about their strategies.

GRAND THEFT AUTO 3 PS2

5 One of the most significant videogames. It was the first to use 3D space and create a whole world. A triumph of videogame design and a bridge point between traditional gaming and a virtual reality experience. You were inside the game – you could learn from its logic. Defender gave you multiple approaches but GTA3 did it on crack.

WARLORDS ARCADE

6 The first really great multi-player game – a party game that engaged people who were playing and watching. Fun, simple and so well executed. Carla Meninsky did the VCS conversion and she's a wonderful woman. Clever, witty and bright, but she totally walked away from the industry after Atari Inc. She was so cool – she [worked on] Star Raiders!

ROBOTRON ARCADE

7 Eugene Jarvis is probably the best game designer ever and this is just outstanding. There are very few games that can generate this intensity and involvement. Now you have my triathlon. Everyday at Atari, I had to get over 100K on Millipede, Defender and Robotron before I started work and this was always the toughest – I suffered from Robotron-elbow regularly.

YARS' REVENGE ATARI VCS

8 I'm not ashamed to choose this. I need it with me. It embodies so much of what my objectives were and what I enjoy in life. Wonderful things came to me because of Yars' and I could create no bliss without it.

BOB POLARO

HE BEGAN CODING IN THE DAYS OF PAPER TAPE, HAD HIS OWN PET AT COMMODORE AND DEFENDED HIS HONOUR AT ATARI. A VETERAN OF THE VCS AND STILL WAGGLING JOYSTICKS THREE DECADES ON, MEET THE CHARMING AND CHILLED BOB POLARO

CURRENTLY: WEBMASTER AND GAME DESIGNER
FAVOURITE FILM: THE HULK

YOU MUST PLAY...

On The Road

Suitably fast and able to make the strongest of wrists ache, *Road Runner* is a simple 'dodge or die' bit of fun. Wile E. Coyote launches various fiendish gadgets at your beeping bird and with some strategic swerving, you can give your pursuer a taste of his own ACME medicine. Released in 1989 as one of the final official titles for the Atari 2600, it shows how an old hand could still hack out a decent game in the 16-bit era on Seventies technology.

We could listen to Bob Polaro all day. His West Coast drawl, his easy banter, his laidback recounting of Atari's halcyon days... all we need in our hands is a Pina Colada and we could imagine that we are there in Sunnyvale, California at Atari HQ circa 1983 when the company was in its prime. We've seen pictures of Bob from back then, dressed in his typical attire of T-shirt, shorts and sandals. Surely his relaxed attitude and wardrobe means he must have fitted in perfectly with the crazy, chilled-out crew that populated the company at its creative zenith?

"Oh no, I felt out of my league," Bob corrects me. "I found everyone was just so super-intelligent. I was surrounded by all these scientific minds, with years of hardware experience and Masters Degrees and there I was, an ex-BASIC programmer with no real engineering experience and less education. But they were all my friends and they helped me. And I could get the job done, by banging my head against the wall..."

Some painful honesty and typical modesty from Bob, as that BASIC experience came with a certain pedigree that could be just picked up. Born in the mid-Fifties in Orlando, Florida, Bob's first taste of computing was when he had numerous fleeting encounters with the paper-spewing IBM mainframes found when he was at High School. Having discovered programmers could earn up to \$10 an hour though, his mind was quickly made up and he would begin chasing his new vocation in earnest. It culminated with Bob spending a year and

a half after leaving college producing business software on the fantastically named WANG computer.

"That machine was pretty similar to the PET and it led to a job with Commodore," he explains. "It was 1978 and they wanted to get into games. They assigned me a Blackjack project [to work on] and I also did this Baseball game for them..."

Bob recalls with some affection the PET's glowing green screen and the crude ball player graphics he fashioned out of ASCII characters. They caught the eye of another expanding company and before the year was out, he'd been recruited by Atari.

"They were doing a home computer and had me working on the prototype. They hired me because of my experience with BASIC games on the PET,

so they'd have something ready for when they were ready to launch the machine and I enjoyed cranking them out."

Bob produced educational titles, like *Hangman* and

States And Capitals, plus the bittersweet business sim *Lemonade Stand* for the Atari 400/800, but it was clear that if he wanted to stay working there, he would need to master the language of assembly and move onto programming the VCS. "I had to pick it up quickly, but I could learn from others there. Warren Robinett and Jim Huether really helped me get going. It was still relaxed then. There wasn't a lot of money at that stage. People were having fun, not feeling pressured and there were no deadlines."

Steep learning curve

Bob got up to speed working on *Stunt Cycle*, his first project for the Atari 2600. He learned fast and soon got a bike jumping over blocks, despite the challenge of reading the paddle controller inputs, as management had perversely demanded that the rotary devices should be used for revving up the engine. The game was nearing completion, when the powers that be had another bright idea.

"Atari was getting in to the whole licensing thing and *Dukes Of Hazzard* was kind of big. The bike became an orange car and now it was jumping over a lake!"

Sadly, the General Lee belly flopped into the water and, not untypical for the time, the project was shelved. However, the experience had given Bob the confidence to take on another big licence. Eugene Jarvis's *Defender* was, of course, huge at the time, but trying to translate an arcade title famed for its many enemies and sprawling array of controls, so that it would work with one joystick, a single button, five sprites and 32K wasn't going to be easy.

"WHAT I WAS UNABLE TO DO WITH HARDWARE, I MANAGED WITH THE SOFTWARE. PLUS THEY STILL ALLOWED FLICKER..."

BOB POLARO

■ Bob dipped his toe in the water of SNES development with *Bass Masters Classic*.

» *Defender* (above) and *Road Runner* (below) were two brave attempts by Bob to capture the spirit of the arcade originals.

» *Hoppin' Harry* (above) is of the many 'one hand' games Bob created for players with a Budweiser in the other...

» *Bugs Bunny* (above) is just one of Bob's 'lost and found' games. *Holey Moley* (below) is another one.

"My main concern was how to get the laser shot from the ship. I tried different things – using the playfield or the missile sprite, but in the end I had to switch the ship, the player sprite, and just make it really big! What I was unable to do with hardware, I managed with the software. Plus they still allowed flicker at that time..." Bob came up with some ingenious solutions. Flying low and firing would trigger a smart bomb, doing the same at the top of the screen would initiate hyperspace and the problem of putting a swarm of angry aliens in your path was tackled by switching between the remaining four sprites he had at his disposal. It was a valiant effort and despite the horrendous flicker, played remarkably well, which might explain why it sold 3 million copies. He even squeezed in an Easter Egg – get to level 25 and fire on the 25th line to see all your adversaries turn into his initials 'BP' – but in retrospect, he knows he could have done more.

"At that point, we didn't really have many ideas about how to do multi-coloured characters," explains Bob. "That would've helped and I think I could have done it without all of the flicker."

The 'we' is rather telling here. Bob paints a heart-warming picture of Atari as a gang of talented programmers, sharing their latest coding discoveries with each other. As it turns out the team would often play together too.

"Every Wednesday, Jim Huether and I would drive over the hill to Santa Cruz and watch beach volleyball. We justified it as 'research' for the *RealSports Volleyball* project. We'd play too – just jungle ball with folks on the beach. We always brought a container of Screwdriver

– Vodka and orange juice – which didn't really help the project but helped with the fun..."

Bob sobered up enough to get the game out, which proved to be another hit. Not all his efforts had such happy endings, mind. He produced *Bugs Bunny*, a cute kids game with mightily impressive graphics, which got canned thanks to management missing the point and playtesting it against *Snoopy and the Red Baron* with 12-14 year olds. Then there was *Holey Moley*, which cleverly utilised the child's numerical controller to replicate the thump of mallet on mole seen in the mechanical Mole Attack arcade games of yore.

"I think both of them were a lot of fun," he continues. "I was trying to do stuff that was good for kids and non-super players, but marketing just didn't get them."

An admirable goal and thanks to www.atari2600.com, you can see what Bob was trying to achieve. But things were changing at Atari.

Financial mismanagement and ludicrous over-hyping brought the once mighty company to its knees. Enter the ruthlessly efficient Tramiels and the party was definitely over for Bob and everyone else at Atari.

Sticking with it

"I tend to stay working at a place till the walls come tumbling down," confesses Bob. "I just don't like moving. After the Tramiels bought the company, they sold half of it and sacked most of the staff, so there were only a few of us engineers left. They took away our offices and put us in cubicles, took away our phones, cut our salaries in half, replaced our development systems with PCs that didn't work and we had to wait

**"EVERY WEDNESDAY I'D
DRIVE TO THE BEACH
WITH A CONTAINER OF
SCREWDRIVER AND PLAY
BEACH VOLLEYBALL. I
JUSTIFIED IT AS RESEARCH"**

BOB POLARO

GAME NOT OVER

Having a project cancelled has always been something of an occupational hazard for programmers, but Bob seems to have been particularly unlucky. However, thanks to the good people at www.atari2600.com, his old codes for *Stunt Cycle*, *Bugs Bunny* and *Holey Moley* have been resurrected and are finally available to buy on cartridge.

"It was nice to see them finally get out there," says Bob about the release. "We sold them at shows in 2002. I was pleased to see there's a large cult following for classic games and there are people who still appreciate them. Maybe they're just appreciating the past. Technology is so sophisticated now – so much memory and 3D engines. No one's going to make dinosaurs when they can make Lamborghinis..."

» Showing off his rabbit wares at a classic gaming show in 2002.

» Defender for the 2600 – blink and you'll miss 'em...

» Stunt Cycle and Dukes Of Hazard – can you see what he did there?

» Stunt Cycle was an early project that was sadly cancelled.

WEB DESIGN

Despite spending most of his time nowadays constructing Internet sites, Bob turned his attention to a different sort of web design in 2004. He answered an ad from local company Santa Cruz Games and worked on a Spider-Man title for Plug and Play Joystick specialists Jakks.

"It was the first time I wasn't the lead on a project and I had a lot to learn. The coding was based on engines you'd use for high end games and it meant a lot of long hours, but I really wanted to get it out. It was a challenge, but the satisfaction of finishing something that's difficult is just great. The challenge itself isn't much fun."

Undaunted, Bob now fancies getting his teeth into a mobile phone game. "I think they're close to my background. They don't require a large team and it's all about the gameplay. But there's a lot of politics and paranoia about which licences to get."

The more things change...

» Bob can still spin his coding magic...

» Rampage wasn't one of the Atari 2600's best conversions...

forever for anything to happen. Yeah, the walls really were falling down..."

Time to hit the road, which is just what Bob did; he spent some time travelling before joining up with some friends developing games for the Commodore 64. He set up his own development company BOBCO (a corruption of 'Bob Co' – the nickname he'd earned due to his prolific software output) and produced the successful educational title *World Geography*. Bob wasn't quite ready to leave the old 2600 behind though and tackled a trio of projects on a freelance basis for Atari – *Desert Falcon*, *SprintMaster* and *Road Runner*.

He also handled the conversion of the popular coin-op *Rampage* for Activision. Hang on, wasn't that like sleeping with the enemy?

"Oh no, I worked at home on a

contract basis and anyway, Atari weren't really doing much with the 2600 by then. That was a tough project, regardless of the platform. You could go anywhere on screen, jump from building to building... so many bugs could creep in. I think every version went over deadline. Was I happy with mine? Erm, well it worked..."

Right until the end of the Eighties, Bob was working his ancient alchemy on that trusty wood-grained console, but as the Nineties began, he did finally move up to the 16-bit machines. He spent two years leading

"THE TRAMIELS SOLD HALF OF ATARI, SACKED MOST OF THE STAFF, CUT OUR SALARIES IN HALF AND REPLACED OUR DEVELOPMENT SYSTEMS WITH PCS THAT DIDN'T WORK. THE WALLS REALLY WERE FALLING DOWN"

BOB POLARO

» Sprintmaster was a game that Bob worked on while he was contracting after he left Atari.

the small team that produced *Bass Masters Classic* and *Pro* for the SNES, though by the time the sequel was complete, the SNES was dead in the water. The team began a PlayStation version and started work on a scuba-diving game before THQ pulled the plug.

As the decade drew to a close, Bob found himself once more doing what he manages to do best – producing little nuggets of fun. He created over a dozen Video Redemption games to run on cabinets located in arcades and bars and converted many into Java for various websites.

"I could turn round a game in a month or so, which

was even quicker than in the VCS days. Any project that takes more than a year, you don't wanna even look at it anymore, but with a series of short term projects each one is interesting. You just don't get sick of it."

And Bob has kept his coding fingers in numerous

little pies. He now mainly creates websites for small businesses, though recently coded *Spider-Man* for a Jakks Plug and Play Joystick. He seems happy to dip in and out of game design as opportunities arise, but knows that the industry has lost some of its early innocent charm that made being at made working at early Atari so memorable.

"Those were the best six years of my life," he smiles. "We were all in our twenties, single, partying together and just having so much fun making the games."

» Volleyball – those blue players look like they've been on the Vodka too.

BOB POLARO'S FAVOURITE VIDEOGAMES

SLUGGERS ALLEY

is sure to be a Home Run!

New from
LAZER-TRON

SLUGGERS ALLEY

ARCADE

1 Originally it was a Video Redemption game, which ran on a standalone cabinet in MS DOS and I ended up modifying it for an Internet game. It was based on the old style mechanical baseball games you'd see in arcades and it had a good feel. There was something about when the ball hit the bat that felt mechanical. Hitting a home run and the fanfare was just great.

DEFENDER

ATARI 2600

2 Yeah, I'll take my version. You could say it's been very, very good to me. I kinda want to keep it around. I wouldn't be that interested in playing it, but it's fun to show it off. Was it my biggest seller? Yes. Am I a millionaire? No.

BATTLEZONE

ARCADE

3 Very simple graphics, but so fast and when you shot something... the explosion just felt so right. It was amazingly well designed. When something's shooting you from behind and you turn round and get them... way ahead of its time.

MISSILE COMMAND

ARCADE

4 I consider this my favourite. When you put up that spread of explosions, that wave after wave structure... nothing compares. I knew Dave Theurer who designed it and he was an amazing guy. When I did Defender, it didn't bother me about mutilating it, as it wasn't one of my favourites, but Missile Command was and I knew I couldn't do it justice on the VCS.

AIR SEA BATTLE

ATARI 2600

5 I like the feel of it, especially the version that let you guide the missiles in mid-air. It was designed by Larry Kaplan, who left for Activision after I'd started at Atari. He was a relaxed guy and a remarkable engineer. This had what I call 'The Factor'. After you'd played it, you'd press the reset button subconsciously and play it again".

SNAP SHOT

ARCADE

6 A game that shows you a picture for a few seconds and you have to answer questions... you know, like how many muffins were in the pan or something. The sort of game you play in bars and I just kept playing it to get better. And yeah, maybe I did gravitate towards bars...

DAYTONA

ARCADE

7 It's the one racing game I really enjoyed. I was introduced to it in Vegas at a CES show there. All these machines were lined up and people were queuing up to play it. At first I kept exploding and my face was up on screen as a loser, but I improved. Playing it against other people, knowing it's your friend out in front and then running them off the road... really addictive.

TETRIS

GAMEBOY

8 My favourite 'pastime' game. There are just so many platforms you can play it on, from Game Boy to PS2. An incredibly well designed game – the ultimate puzzle game. No, I'm not really good at it – my lady friend is always beating me...

DAVID CRANE

Canyon Bomber was one of David's earliest Atari 2600 games.

Following a telling company memo and a life-changing game of tennis, David Crane decided to leave his job at Atari in 1979 in order to form Activision with fellow Atari coders Larry Kaplan, Alan Miller, Bob Whitehead and music industry exec Jim Levy. Here this talented collective of people aimed to create original, high quality VCS titles, award programmers recognition for their work (something which wasn't recognised at Atari) and, most importantly, separate the software business from the hardware.

The ramifications of this can still be felt today, as Activision remains the biggest publisher in the videogame industry, responsible for huge yearly franchises like *Call Of Duty*, *Prototype*, *Guitar Hero*, *Tony Hawk*, and more recently, *Skylanders*, which is based on the popular *Spyro* series. Having recently completed his 68th published game for Apple's iPhone, David chats to Stuart Hunt about his prolific career in the videogame industry and gets him to share his thoughts on the new-generation Activision...

So David, what did you want to do when you were still at school? Was it a lot different to what you ended up doing?

There were three main factors driving me through my early years at school. First, I was always fascinated with technology and engineering. I found it difficult to imagine that anyone could look at a television screen, for example, and not want to understand how a picture could be plucked out of thin air and 'painted' onto the back surface of a glass tube. By the time I was 12 years old I knew the answer to that question and thousands of other technological mysteries. Second, when we are young we don't have the financial resources to simply buy something to fill a need, so I became an inventor. Using junk from around the garage, or parts from an Erector Set, I tinkered in the basement at all hours (when I was supposed to be studying). Some examples include:

When our small town first opened a community swimming pool I spent so much time there that I sunburned my shoulders to a crisp. I built a foot-pedal-operated mechanism attached to the wall that sprayed my shoulders with sunburn spray.

For a science fair I designed and built an unbeatable Tic-Tac-Toe machine using nothing but rotary switches and lights. Sadly, it went up in smoke the night before the competition.

When I received an old, used black and white television as a birthday gift I dismantled it so that I could have the channel tuner near my bedside and the TV in a cabinet on my wall.

To impress the neighbourhood I fashioned a 'laser' that, in a flash of light, could ignite a match at the far

end of a workbench (a loop of Nichrome wire around the match head completed that illusion).

Finally, my mother, an artist trained in a number of painting styles, made sure I experienced the arts. I took watercolour painting classes and such, but I never developed much of an interest. A painting took too long to perfect, and when you were finished with it you only had a single copy. So besides getting a little right-brain training I also learned the value of mass production.

Given these factors I was certain that I would end up designing household gadgets to improve the quality of people's lives. I had the technological skills to make almost anything work, and I had just enough

"TO IMPRESS THE NEIGHBOURHOOD I FASHIONED A 'LASER' THAT IN A FLASH OF LIGHT COULD IGNITE A MATCH AT THE FAR END OF A WORKBENCH"

DAVID CRANE

aesthetic training to understand the need for look and feel. Ironically, videogame design was even a better fit for that combination of skills. But as I was growing up there was no such thing as a videogame, so how could I know?

Tell us about your first experience with a home computer...

Home computers did not arrive until I was in college. But mainframe computers from IBM could be found in some businesses, and I had a lucky connection. I was in the Boy Scouts, and my Scoutmaster worked in data processing. On a visit to his office I became fascinated with the equipment. I asked to be one of the first to attempt to earn the newly created Computer Merit Badge. Through his help and access to his facility, I learned the Hollerith code for punched cards (I still remember that code), and got a good grounding in the technologies involved. A few years later, in high school I attended a computer programming extension campus. I travelled by bus every morning to a nearby city, studied computers for three hours, and returned to my normal school for the afternoon. I was one of the few people in

FIVE TO PLAY

PITFALL! ATARI 2600

1 The concept may have taken David ten minutes to think up, but that didn't stop *Pitfall!* becoming the bestselling 2600 game of all time, selling over 4 million copies on the console alone. The game saw an adventurer named Pitfall Harry on a mission to find 32 pieces of treasure while having to negotiate various environmental hazards and deadly creatures. *Pitfall!* was praised for its quality visuals, slick gameplay and animation, and quickly gained interest from VCS owners on its release owing that there was nothing else like it on the machine. The game's popularity and success helped to bring David and Activision immediately to the fore, and in the following

year a sequel, *Pitfall 2: Lost Caverns*, was released. The follow-up was notable for featuring scrolling and for expanding and refining areas of the game.

A BOY AND HIS BLOB: TROUBLE ON BLOPOLONIA NES

2 After finishing *Pitfall 2*, David left the action/adventure game genre for a while and didn't return to it until 1989 with the release of this quirky NES platformer. *A Boy and His Blob* is notable for its unique buddy system: the player controls the boy but is aided on their quest by a computer-controlled character named Blob, who can be fed jellybeans.

GHOSTBUSTERS COMMODORE 64

4 Only David Crane could turn the most successful comedy film of the Eighties into a business sim and still capture the magic of the movie so brilliantly. Activision's *Ghostbusters* plonked players inside the slime-covered boots of the eponymous team of paranormal exterminators. Starting out by purchasing your very own Ecto-1, you equipped your team with various gadgets before traversing the many blocks of New York City, busting ghosts until your inevitable date with Gozer.

DAVID CRANE'S AMAZING TENNIS SNES

3 Given that David is a huge fan of tennis it comes as little surprise that he would decide to marry his passion for the sport with videogames. *Amazing Tennis* is notable for featuring a 3D court and an attention-grabbing perspective: the camera was positioned just behind the camera as opposed to above the court, which gave the game a more realistic feel.

LITTLE COMPUTER PEOPLE COMMODORE 64

5 Undoubtedly a precursor to the *Tamagotchi* and Will Wright's super-successful *Sims* series, the high concept behind *Little Computer People* caused quite a stir on its release. The original idea can be credited to artist/musician Rich Gold, who came to Activision with an idea to produce a software version of the Pet Rock. Activision invested thousands in the project, and David helped Gold refine the concept – adding the interactivity and communication element.

the Seventies to leave high school programming computers in three languages.

And what was the first game you actually encountered there?

My parents bought the first Magnavox Odyssey home game console. This unit displayed squares of light on the screen with no graphics. Magnavox supplied coloured overlays that you would stick on the TV screen to make different games. I have to admit that I was bored by the rudimentary games, but I was fascinated by the potential of the technology [it offered].

When did you first think to yourself: I reckon that I could make myself a career out of this videogame lark?

It would be years before I thought of making a career in videogames. My head was brimming with inventions. Tired of resetting digital clocks after a power failure I invented a clock that derived its display by communicating over a power-line-interface with a master clock. To accompany me as I learned to play the guitar I created a programmable drum machine (I even tried to market that one through one of those late-night infomercial invention marketing companies). I even designed a 3D TV using a flat, spinning phosphor target inside an evacuated sphere.

I had far too many things to invent – who had time for games?

What did your parents think about you joining the industry, which was still relatively new at the time?

My parents helped me move to Silicon Valley after college. They looked around and saw ten high-tech businesses per block, and they knew I would be fine. To them Atari was just another computer business (my Mom was soon even happier, because I made her a Slot Machine game that she could play at home any time, day or night).

So what jobs did you do before you ended up working at Atari?

My first job in the Valley was as a technician at National Semiconductor. I had worked for a couple of years at school as the lab professor's technician. When he created new lab projects for students I had to build them first and help tweak them for the class. I also built my first computer in college – a machine that plays *Tic-Tac-Toe* (which still works).

With all of the experience I had working with digital circuits, I recognised that there were some fields of electronics with which I had no practical experience. I took the job at National working with linear integrated circuits, stunning my advisors (that is as far away from computer chips that you can get). But I had a plan. To be the inventor I wanted to be, I needed to be proficient in many areas of electronic design. That job was just the next step in my career development.

Can you tell us what was it like working at Atari at that time?

I wasn't sure I would actually like programming games. My first love has always been designing electronic circuits, and this would be only programming. As it turned out I still got my fill of

Pitfall! is one of David's biggest games.

circuit design over the years, developing a number of electronic circuits to help make game design easier. But I found that I enjoyed microprocessor programming and game design.

The working environment in my first days at Atari was very rewarding. My co-workers were dedicated professionals working hard to advance the state of gaming. Nolan Bushnell would come by occasionally to see what cool thing we were working on – although his catch word was “neat”. The hot tub parties in the lobby and drug use in the office was long past, which is good because I wouldn't have tolerated that. I was only there for two years before Atari lost its way. I got out and started Activision just in time.

How many games did you work on while you were at the company?

While at Atari I designed and programmed: *Outlaw*, *Slot Machine* and *Canyon Bomber/Depth Charge*. Then the Atari 800 computer needed software help so all of the original 2600 game designers stepped up and wrote the operating system for Atari's new line of personal computers.

So tell us about the genesis of Activision; how was it formed?

A lot went wrong at Atari in 1979, in spite of the fact that they were making \$100 million per year selling videogame cartridges. They made a classic mistake, one that is repeated over and over in every business. They didn't follow rule number one: If you make your living on creative products, keep your talent happy.

Four of Atari's most successful game designers: Larry Kaplan, Alan Miller, Bob Whitehead and I tended to hang around together. One day we discovered that we four had created games that accounted for 60 per cent of Atari's \$100M in game cartridge sales for the previous year. We were making less than \$30K salaries.

When we asked Atari's new president (Nolan was no longer there) for a piece of the action, we were told 'You are no more important to the success of those products than the person on the assembly line who puts them together.'

We didn't agree so we left to form our own game publishing company. We met up with Jim Levy and together created Activision.

We've heard this story from other Atari developers. You must have felt tremendous satisfaction when you were finally given credit for the games you made...

That was a founding premise of the company. We started our own publishing house because we felt that people would like to know who authored their favourite game so that they could buy their next one.

What was really fun was going into the game store the day our first four games shipped. The owner of the store was just unpacking the boxes and looking at our pictures as we entered the store. He did a classic double-take.

When you co-founded Activision in 1979 did you ever anticipate it would become one of the biggest companies in the industry?

At the founding of the company, videogames were largely considered a fad. We certainly knew better. The videogame provided a way to interact with your TV, which promised a more immersive experience than either television or movies. And both television

“I WAS ONLY THERE FOR TWO YEARS BEFORE ATARI LOST ITS WAY. I GOT OUT AND STARTED ACTIVISION JUST IN TIME”

DAVID CRANE

and movies had proven themselves to be more than just a fad.

The Activision of the 1980s has very quickly become the biggest company in the industry. So we didn't have to long to wait to find that out. At one point a financial analyst made the case that Activision was the fastest-growing company in the history of American business. I think it is also great that the Activision of today has regained [a lot of] that dominance. The company's current management has done a great job of leveraging the Activision name and developing cutting-edge products that continue to keep it at the top.

What was the secret to Activision's success?

In the early days of Activision our primary focus was quality. We continued to work on a game until the whole group could say it's as good as it's going to get. Most times that meant a whole lot of rewriting and tweaking. And sometimes a game never reached that threshold and it was shelved.

Uncertain schedules played havoc with the sales and marketing folks, making it hard to predict when

David invented many things before designing games, including a programmable drum machine.

the next game would be coming. But after a while we got pretty good at predicting, and we were able to commit to a number of games from each designer (we just couldn't say what the game would be until it was finished).

We were the small, upstart company so we couldn't let our players down. And we succeeded... People raved that each Activision game was better than the last, and far ahead of the competition.

Activision had always striven to create new IP instead of arcade ports. Why was this?

That was a sign of the times. The Atari 2600 was designed to bring Atari's arcade games to the home. A lot of the game development time at Atari was taken up making home versions or their arcade games. Activision didn't own any arcade hits, so we had to create new games from scratch. Of course, that was more fun anyway.

The market was pretty small at that time as well. When there are only two dozen games on the shelf, a buyer can study all of them before making a choice. Once there were hundreds of games it made sense to attach a pre-sold label to a game.

And how do you think the Activision of yesterday compares to the one of today. Is it any different now?

There is no comparison. The Activision of the Eighties was a research project. Every aspect of the business, from technology through marketing had to be invented. You could fill a textbook with the ideas pioneered by the over-achievers who flocked to work at Activision. And many of those ideas are still in common use today.

The developers

Today's Activision is a highly evolved publishing business. They are very good at what they do. But to try to compare the two companies would be like comparing America's founding fathers to Washington DC of 2010.

Little Computer People was one of your more innovative games. How did it come about?

The germ of the idea came from an artist/musician by the name of Rich Gold. He wanted to make a software version of the Pet Rock. He raised some money and had some early programming done before showing it to Activision. I saw the start he had made and was intrigued. Activision covered all his expenses and spent several hundred thousand

"IF MY NAME IS ON A GAME, YOU CAN BE SURE THAT I WROTE THE MAJORITY OF THE CODE"

DAVID CRANE

dollars more on the project, including almost a year of my time.

Rich's idea had a flaw. The beauty of the Pet Rock was that you could sell for something that cost nothing for ten dollars, but only if you surrounded it with a great story. *Little Computer People* (which was originally called Pet Person) was the opposite. Its cost was astronomical, so it had to be sold at a high price, and therefore it had to provide some real entertainment value.

I added interactivity, communicating both to and from your LCP. Our marketing department surrounded it with a compelling story about gremlins living in your computer, etc. I worked with the production department to figure out how to make every disk unique, each with its own special LCP. It was one of the most demanding software projects developed in the 1980s. We weren't sending a man to the moon or anything, but we created a convincing life form inside the C64.

Why do you think the *Pitfall!* franchise has proven to be so popular with gamers over the years?

First, the platform game genre was the most expandable style of game found on the early consoles. A game designer could take the player to any world that he could envision (as long as the console could display that vision).

Second, even as the first of its genre, *Pitfall!* provided a lot of game play. Within the limits of a 4KB ROM, it was rare to have more than a few game screens. The technical trick I pioneered for that game – using an 8-bit polynomial counter

to define each screen – provided for more than 200 screens of game play.

Finally, in gaming, each sequel has to be bigger and better than the last. So when you start with an original game that has so much more in it than other games, each sequel is forced to be that much better.

Pitfall! represented a big leap in gameplay. And each sequel had to be even better, so the whole body of work tended to stay ahead of the curve, keeping new audiences happy while remaining true to the spirit of the original.

Which of your games are you most proud of and what makes it special to you?

I recently completed my 68th published game, and each one has something about it that I consider special. Sometimes the part that makes me proud is a unique game play feature, and sometimes it is an extremely esoteric programming technique that might take several pages of explanation. To list a few:

Most obscure display technique: Atari 2600 *Dragster* for the moving 48-bit dragster kernel.

Best overall use of the Atari 2600 hardware: *Grand Prix* for the size and colour of the car, and the edge treatment of the disappearing cars.

Image compression/decompression: C64 *Transformers*, for run-time rendering of two-dimensional textured parts for its excellent transformation animations.

Digitised speech player: C64 *Transformers* again, for custom disk driver pulling real-time audio data from the flip side of the disk.

Best computer opponent: *Candystand Billiards*, computing bank shots through the use of phantom pocket projections.

Screen data generation: *Pitfall!* 8-bit reversible polynomial counter.

Are you still in touch with any of your former Activision co-founders?

After impressive Atari 2600 owners with the excellent *Pitfall!* David created a sequel, which continued to push Atari's machine.

We will run into each other occasionally, particularly at classic gaming events. But despite the fact that we still live in the Bay Area, it is a big place and we have spread out pretty far.

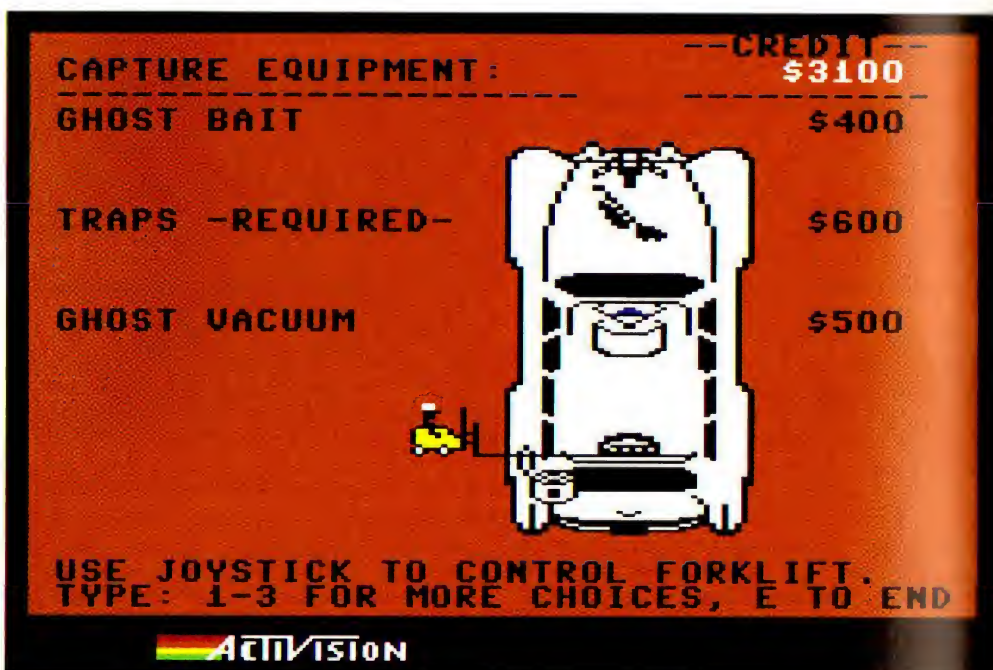

Tell us a little about the forming of Absolute Entertainment; why did it come about?

When the videogame business crashed in 1983, Garry Kitchen and his co-workers in Activision's eastern design centre spun off to form Imagineering Inc. to do contract game development. They developed the Simpsons games for Acclaim, and became the largest North American developer for Nintendo NES games.

After a few years of success as developers they decided to also publish games, creating Absolute Entertainment as a brand. Garry contacted me to help to create and expand a line of games for Absolute, and before long I joined the company full time and he and I were working together again.

Were you still coding games then?

If my name is on a game, you can be sure that I wrote the majority of the code in the game. I find

Solving the problem of a short turnaround, this and the driving section of *Ghostbusters* were taken from a game Activision already had in production titled *Car Wars*.

that programming is the best way to guarantee that a game will meet my standards. It is the program that breathes life into the characters and gameplay.

That often means learning a new game system or a new programming language, but that is the price I have to pay to keep control. I wouldn't have it any other way.

Why did you decide to close the company in 1995? And how difficult a decision was that?

The videogame business runs in cycles. I have been in the business for 33 years, and over that time there have been a number of boom and bust periods. Absolute ran into a bad patch in the business and couldn't sustain operations. The cost of ROM cartridges from Japan, coupled with heavy-handed retailers squeezed game publishers to the point that they could no longer make a profit. With ROM cartridge games, a publisher had to order goods far in advance. If you ordered too many you would be stuck with games you couldn't sell. If you ordered too few you would be giving up profits. It was painful to close down Absolute, but the same was happening to small publishers all around the world.

And it was then that you set up Skyworks Technologies. Tell us a little about it...

After Absolute, Garry and I decided that we would stay away from a business that had inventory risk. We decided to treat the internet as a game platform, and we began designing games that could be played in a browser. In 1995, people had not yet become comfortable buying anything online – if you remember, people were terrified that their credit card information would be stolen. So we had to come up with a new business model.

We created what would later be known as Advergaming. People weren't shopping online, but they were browsing, and companies were trying to get the attention of the casual internet user. There

is no better way to do that than to give people free games to play. So we developed games and licensed them to companies to put on their web sites. It made for a three-way partnership: we got paid for making games, people got to play games for free and advertisers could draw people to their web sites. It worked a lot like the early days of commercial television with sponsored shows.

Tell us about Candystand...

The Candystand was Advergaming applied to a dedicated gaming site. The Lifesavers Candy

"IF MY NAME IS ON A GAME, YOU CAN BE SURE THAT I WROTE THE MAJORITY OF THE CODE IN THE GAME"

DAVID CRANE

Company spent a lot of money on brand promotion. For the Candystand we took a small percentage of their promotions budget and built a place to play games. Lifesavers brands would sponsor the games as if they were outside advertisers. Skyworks provided dozens of brand-new games that could only be played on the site, generating as many as 80 million game plays per month.

The Candystand delivered the lowest cost per brand impression of any internet advertising method. In other words it was the most successful form of internet advertising in that decade.

And your collaboration with ESPN... how did that come about?

A number of times over the years, Skyworks worked with ESPN to provide games and promotions. Eventually ESPN decided to hand over the reins of its gaming site. We created a special ESPN game site similar to the Candystand. But in this case they sold advertising space to other companies. This was a moderately successful arrangement, only limited by the learning curve of their salespeople who could never quite understand the difference between sponsorship and advertising.

You later moved into the iPhone market and have been doing quite well in it. What do you think of the iPhone as a gaming device?

I love the iPhone as a gaming device. I love the iPad even more. For years we have waited for the cell phone that could play games, and the iPhone is the first real candidate. But you don't need me to tell you that – just compare the number of games available for the iPhone to any other handheld device.

So why did you then decide to set up AppStar Games? What was the appeal?

Garry and I sold Skyworks in 2007, but we agreed to continue to work with the company for a period of time. In October 2009 we parted company.

I have been designing games since 1977, so it is only natural that I will continue to do so. At AppStar Games we plan to publish games for the iPhone, iPad and various other handheld devices.

BY THE NUMBERS

David's first game was *Outlaw*, it was released in 1977.

Pitfall! featured over **200** screens of gameplay.

Pitfall! quickly became one of the best-selling Atari 2600 games ever, with over **4 million** copies of the game sold on the console alone.

David has recently put the finishing touches to his **68th** published game.

A Boy And His Blob featured **14** different flavoured jellybeans that could be giving to the Blob and grant him special powers.

The concept behind *Pitfall!* took David around **10** minutes to think up, but it took him around **1,000** hours of programming to complete it.

For most of David's adult life he played tennis with an national tennis rating of **5.0**. Very few reach this level, and the best rating you can achieve is **7.0**.

There are **8** games in the *Pitfall!* series, including an arcade version of *Pitfall II* developed by Sega. David has only worked on **3** *Pitfall!* titles.

Despite leaving Activision in 1986, David still occasionally sees the other co-founders.

The developers

What do you prefer David? Managing or programming games?

I still program games every day. The only distinction I might make is that I am not just a game programmer. We use the term 'game designer' to describe a programmer who also figures out how to put the fun into the game. That is what I do.

I rely on other experts – artists, animators, composers, sound effects specialists etc, but what I do is to take the work of these others and breathe life into them. I create a complete world in which they have an existence of their own, and it is this world into which the player is allowed a glimpse.

Aside from your excellent *Atari Magic* apps, what else can we look forward to?

I developed the *Atari Magic* apps just to document some of the more obscure tricks that were needed to make a game for the Atari 2600. It wasn't much more than a labour of love. I haven't had time to do any more in that series, however, because we got busy developing *The Iron Horse* for both Apple's iPad and iPhone.

The Iron Horse is a very simple game – by design. At a recent conference I spoke to a number of contemporary game designers. One told me that "I can design a giant story game with hundreds of things to do and see. But it is really hard to make a simple game that is just fun to play." Figuring out something that is simple to do and yet still fun is what Garry and I do best. That is embodied in *The Iron Horse*. At first blush you will think of it as too simple to be interesting. But a few minutes into the game you might be surprised.

As one reviewer put it, "When I sit down to play a game or two, it becomes nine or ten. It's just

very easy to pick up and play, very intuitive. I never once played it for more than five to ten minutes at a time, but it's always one of the first games I'd play when sitting down with the iPad with intent to do something else."

How do you find the iPhone to program on compared to earlier systems?

All game systems have their little quirks, and I suppose the iPhone is no different. But one of the most important issues when dealing with a game console is performance. How fast will my game operate on the device? The iPhone performance is great. And more importantly, because the iPhone doesn't run multiple apps simultaneously, a game designer can count on the same performance for every player, every time. When you hear complaints that the iPhone doesn't run multiple apps, consider what will happen on those devices with multiple programs vying for one CPU.

"ATARI MADE A MISTAKE – ONE THAT IS REPEATED OVER AND OVER IN EVERY BUSINESS"

DAVID CRANE

What do you think about the current videogames market David?

There are some great console games on the market. There are games that required dozens of talented people working many years to complete. Those games are not my cup of tea, either making or playing, but as a player you should enjoy them. A lot of things have to come together to make them possible, and unless you support them with your purchasing dollars you won't get to see the next generation of that game.

How has the industry changed since you started, and do you think it has changed for the better?

As I have said, the biggest change in the industry has been direct-to-consumer sales of games. Large studio games will still be funded by one of the larger publishers like Activision, but direct sales make it possible for many smaller developers to create games and get them to market.

Ghostbusters was an absolutely massive success for Activision and proved that it was perfectly possible to make a brilliant game out of a comedy.

David Crane remains immensely proud of *Grand Prix*. At the time it really pushed the hardware technology found in the Atari 2600.

This can be a very good thing for some, but it actually causes other problems. One of the biggest problems is the lower price points for games. A teenager making a game in his bedroom might be happy to make a few hundred dollars on a game, so he has no problem offering the game at 99 cents (I have read of guys who were perfectly happy that they were able to buy a new Mac on the proceeds of a game). But professional game studios have to pay half-a-dozen professionals, pay the rent, utilities and health insurance for two dozen employees. That is hard to do if the expectation is that a game is only worth 99 cents.

When I spend thousands of hours making a game, including tens of thousands of dollars of art and sound development, I still have to sell the game for only a dollar or two. Thanks to thousands of teenagers making games at home, that is what the market has come to expect. Once you play a game made by a professional design team, you can certainly see the difference. But until you do, it is hard to get noticed.

There's just one last thing we'd like to ask before you go David: Just how good are you when it comes to playing tennis?

For most of my adult life I played tennis with an NTRP (National Tennis Rating Program) rating of 5.0 (this is a standardized scale from 1.0 for beginner to 7.0 for Roger Federer). A very small percentage of the millions of tennis players achieve a rating of 5.0 or better. Tennis has been a lifelong passion, and it helped to make *Amazing Tennis* into a realistic simulation of the game (it was named for the amazing 3D parallax display never before seen on the SNES).

I still play tennis in tournament and league competition, but due to age and injuries I no longer play at the 5.0 level.

David wasn't adverse to getting inspiration from other games. *Outlaw* is similar to some ways to the arcade game *Boot Hill*, which was once very popular.

MORE FROM DAVID CRANE

THERE ARE PLENTY OF OTHER QUESTIONS WE WANTED TO ASK DAVID, HERE ARE SOME HE ANSWERED...

■ Who did the at voice sample in the *Ghostbusters* game? It was really memorable.

That is a good question – and one that I don't clearly remember. I had written an audio digitiser and driver for the C64. The actual voice sample would have come from Russell Lieblich, who sadly passed away in 2005. Russell provided music and sound effects for many of Activision's games in that period of time. I'm sure he would have first tried to use the voices from the movie theme song. But it is possible that he was unable to isolate that sample from the underlying theme music, which would have made the sample unusable.

If that happened he would have probably set up a microphone and borrowed people in the company. But I don't know for certain, and I am sorry to say that we can no longer ask him.

■ Have you ever been tempted to make *Pitfall 3*?

Pitfall! (the license) remained the property of Activision after I left in 1987. So I never thought much about resurrecting Pitfall Harry after my departure. But I do like side-view adventures, and I have done a number of games in the genre since then as online games.

■ Do you still have the personalised license plate "Pitfall"? If so, how much to buy it from you?

I still use that license plate since I put it on my car in 1982. I had an old 280Z that was due to be replaced, and I was on vacation thinking about a new car and what custom license plate I might like. There was no way to get "Activision" to look good with only seven letters, and that was a disappointment. When it struck me that Pitfall would fit perfectly, I cut my vacation short to get to the DMV.

As for buying it, I would gladly consider any seven-figure offer.

■ Have you ever finished a project and immediately thought of a dozen ways to improve it? Every game project ends because it hits a limit, and that limit is rarely a lack of ideas. In the early days we ran up against the ROM limit before any other. As technology improved a project ran out of time or budget before running out of memory. But in either case the key to videogame design is to get as much playability into a game within available limits.

There has never been a game that couldn't have been made better with more time, more budget or more memory.

■ What non-Activision Atari 2600 game impressed you the most?

While still at Atari, Rob Fulop did a great job on the 2600 version of *Missile Command*.

Making a 2600 version of an established arcade game is one of the toughest challenges in our field, and that was very well done. A second choice would also be a Rob Fulop game: *Demon Attack*. There wasn't a lot to the game graphically, but that could be said of most 2600 games. Rob tweaked the game very well, keeping the game compelling as it ramped up in difficulty over time.

■ What was/is your biggest programming regret and why?

Looking back I wish that *Little Computer People* had been a commercial success. While it was a huge critical success, there was so much programming in the game that it cost more to produce than it made at retail. We had dozens of ideas for follow-up products, but if those ideas were going to lose money the company couldn't afford to produce them. I regret that.

Dragster was an early Activision title and served as a warning shot of the great things to come.

David's latest game is *Iron Horse*, an addictive game designed for the iPad.

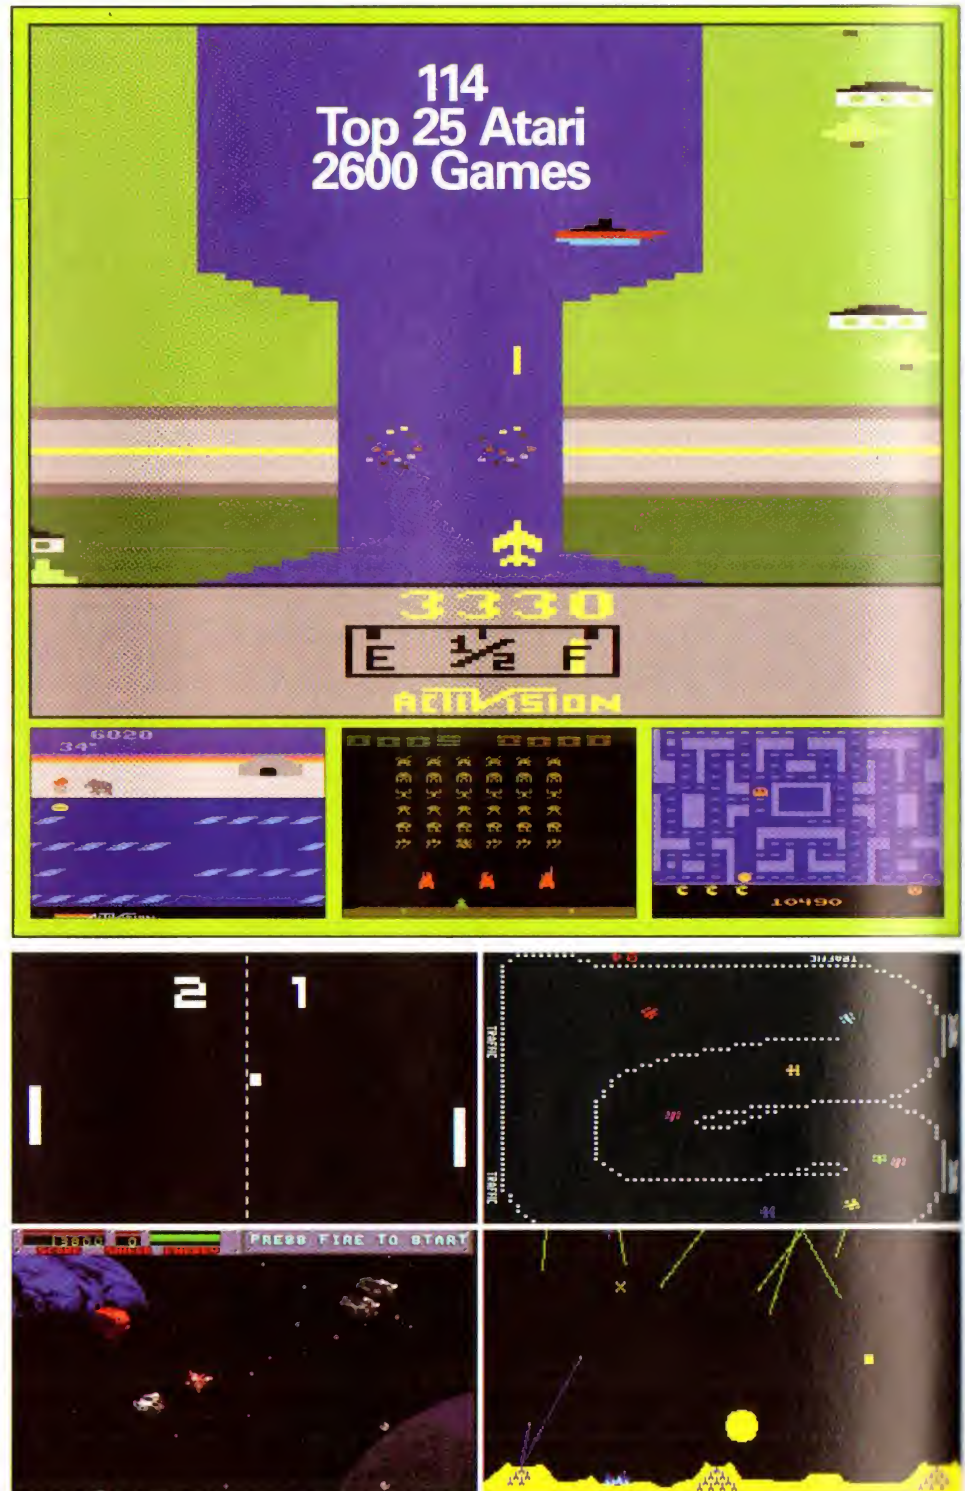

David loves tennis, and *Amazing Tennis* is a great testament to his passion for the sport.

ATARI HAS BEEN BEHIND SOME OF THE BIGGEST ARCADE GAMES OF ALL TIME. FROM PONG TO STAR WARS, WE REVEAL THE CREATIONS OF THESE CLASSIC ARCADE HITS

A NEW AUDIO-VISUAL EXPERIENCE FROM ATARI

TOP 25 ATARI 2600 GAMES

IT'S EASY TO SCOFF AT HIS CHUNKY VISUALS AND PRIMITIVE SOUND CHIP NOW, BUT THE ATARI 2600 WAS A REVELATION WHEN IT WAS RELEASED IN 1977. BUT HOW DO YOU GO ABOUT DISCOVERING THE BEST GAMES FOR THIS EXCELLENT CONSOLE? SIMPLE, JUST READ THE FOLLOWING READER VOTED PAGES, WHICH REVEAL SOME OF THE BEST GAMES FOR ATARI'S BELOVED MACHINE

PHOENIX

■ Year: 1983
■ Publisher: Atari Inc

25 Considering the basic architecture of the console, the Atari 2600 was able to churn out some surprisingly faithful arcade conversions, as the rather wonderful *Phoenix* proved.

Not only did Atari do a brilliant job of capturing the spirit of the original arcade hit, it also ensured that all the levels were present and correct as well, meaning there's a fair amount of variety to be found as your X-wing fighter (well that's what it looks like to us) shoots down a variety of distinctive alien waves.

Far slicker than *Galaxian* and filled with plenty of nice little touches – pressing down activates your shield for example – *Phoenix* is the perfect way to kick off our top 25 and proves that faithful arcade conversions were actually possible on the 2600. They just needed to have a talented coder.

COMBAT

■ Year: 1977
■ Publisher: Atari Inc

24 Sometimes it's the simplistic games that work the best. *Pong*, *Space Invaders* and *Pac-Man* are all considered to be timeless classics, and all three games are incredibly easy to get to grips with. Surely this can't be some sort of coincidence?

Combat, may be one of the earliest and most basic of the Atari 2600's releases, but don't let that put you off, as underneath its Lego-like surface beats out hell of an addictive game. A game for two players, *Combat*'s premise is laughably simple, yet hellishly addictive – you and your opponent simply face off against each other on opposite sides of the screen and have to shoot each other down as many times as possible.

With its huge range of game modes – 'Tank Pong' is superb – *Combat* proves that you don't need fancy visuals to create a great game.

RAIDERS OF THE LOST ARK

■ Year: 1982
■ Publisher: Atari Inc

23 While it can't hope to better the simple majesty of *Adventure*, Howard Scott Warshaw's take on the hit Steven Spielberg film still managed to turn heads when it was first released.

Granted, it's not the most accessible of adventures to start with and if you don't use the instruction manual it can take a very long time to work out what to do, but once everything clicks together you'll find *Raiders Of The Lost Ark* to be a solid adventure game that features lot of nice little touches. Our favourite is how the left controller manages your inventory, while the right moves Indy, it also requires plenty of cunning and joystick dexterity in order to complete, which is no bad thing in itself. There's even a fairly nifty rendition of the *Raiders Of The Lost Ark* theme tune to enjoy. A very solid and entertaining adventure that shouldn't be missed.

FROSTBITE

■ Year: 1983
■ Publisher: Activision

22 Write *Frostbite* off as just another *Frogger* rip-off and it's obvious that you've not spent any real time with Activision's game. While it obviously borrows heavily from Konami's cult coin-op there are plenty of neat mechanics that allow the platformer to stand proudly on its own two feet.

Tasked with building himself an igloo, your Eskimo had to leap backwards and forwards across four sets of ice floes (landing on a floe automatically built a block of your igloo) complete your igloo and progress to the next harder stage.

While birds, crabs and other aquatic menaces tried to push you off the floes, it was possible to reverse their direction and hopefully avoid a watery death. With its tight controls and even tighter time limit, *Frostbite* successfully emulates the arcade hits of old and proves to be frightfully addictive stuff in its own right. Highly recommended for those who like a stiff challenge and have lightening fast reflexes.

"PHOENIX IS THE PERFECT WAY TO KICK OFF OUR TOP 25 AND PROVES THAT FAITHFUL ARCADE CONVERSIONS WERE ACTUALLY POSSIBLE ON THE ATARI 2600"

ENDURO

■ Year: 1983
■ Publisher: Atari Inc

21

While the 2600 version of *Pole Position* did a fairly good job at emulating its arcade parent, it looked incredibly sluggish next to the mighty *Enduro*.

Although its graphics are nothing to write home about – the landscape is virtually barren with just a few tiny mountains in the background – it was the entertaining gameplay that made Activision's racer so special.

Each day you're required to pass a certain number of cars in order to progress, and later levels became a desperate race against the rising sun that saw you frantically weaving your way through the dense traffic. As your advancement continues, day turns to night (and opponents become little more than scary blips of light) and you'll eventually start to battle against elements like rain and snow, which subsequently impacts on your car's handling. It's all extremely clever stuff and is arguably the 2600's best racer. Just don't tell *Pole Position*.

BATTLEZONE

■ Year: 1983
■ Publisher: Atari Inc

20

Atari's 2600 conversion of *Battlezone* may lack the wire-framed elegance of its arcade parent, but don't let that put you off.

This is a resoundingly solid effort that captures the cat-and-mouse spirit of the original game perfectly. Well it would do if all the obstacles you could hide behind in the original arcade game had been included. Doh.

Worry not though, for while the lack of cover does take away an important element of *Battlezone*, the end result is no less intense and actually makes for an incredibly exciting experience. Wheeling around in your huge tank and trying to take out an enemy is far more exciting, due to the fact that he could turn at any time and take his own shot at you. Of course, it is possible to steer out of the way of the enemy bullets, but the sparse landscape means there's very little chance of escape, therefore ensuring that the action remains constantly fast and furious.

Ok, so *Battlezone* is far from perfect, but it does manage to offer plenty of bang for your buck and is still brilliant fun to play. It still manages to capture those frightful moments when you were targeted by an enemy tank and that's good enough for us.

CENTIPEDE

■ Year: 1982
■ Publisher: Atari Inc

19

There is no way that *Centipede* should possibly work on the Atari 2600. The

arcade hit boasts insanely fast visuals and requires an incredibly precise trackball in order to get the most out of it, and the 2600 features neither of these things. Nevertheless, if you can put aside the initially skittish controls, headache-inducing flickering and block-like visuals, you'll discover that *Centipede* on the 2600 this is a surprisingly authentic blaster that provides hours of entertainment.

It certainly takes a while to master those twitchy controls, but once you've managed to get your craft under control you'll find the Atari 2600 *Centipede* to be just as addictive as Ed Logg and Dona Bailey's original classic. The action throughout is furious and relentlessly unceasing, sound effects are surprisingly authentic, and while there are only two different game modes to choose from, the addictive nature of the game more than makes up for it. A solid blaster that shoots first and asks questions later.

SUPER BREAKOUT

Year: 1978

Publisher: Atari Inc

18

We've said countless times in *Retro Gamer* that the simplest concepts often make for the best games, and here's yet another example to add to our ever-growing list.

Played with the Atari 2600's paddle, *Super Breakout* presents you with a colourful wall that has to be knocked down, one brick at a time. Depending on how you hit the returning ball will depend on its subsequent speed and trajectory and as the wall diminishes, the ball gets faster and faster.

There are no power-ups for you to pick up here, so don't expect to see any icons dropping down. It's just a paddle, a wall, a ball and your reflexes. Nothing more and nothing less. Sure there are some fun options that grant you dual bats and the chance to free extra balls, but regardless the end result is always the same. A great game that requires skill and plenty of it.

SEAQUEST

Year: 1983

Publisher: Activision

17

Despite possessing the agility of an iron girder, there have been countless games centred on the good ol' submarine: *Dive-Dive-Dive*, *In the Hunt*, and thanks

to Activision the 2600 can also join these denizens. Taking control of a sprightly sub, it's your quest to salvage an army of divers caught up in some heavy underwater traffic. You have to blast enemy subs and sharks capable

of ripping through steel, while keeping a tentative eye on your gradually waning oxygen. When you've collected enough divers you have to resurface, disembowel and repeat the whole process.

Graphically, the game is pretty slick. All the enemies are distinguishable and the collision detection is bang on the money. Sadly, because the game is split over one entire screen, the game can become a tad repetitive.

SOLARIS

Year: 1986

Publisher: Atari Corp

16

As a technical showcase, Doug Neubauer's *Solaris* can be heralded as one of the finest pieces of code written for the 2600.

As a game, however, it's as mad as a hatter. You're on a perilous mission to find the mysterious planet Solans. On your journey you'll blast waves of Martians, steer your ship into beautifully drawn planets, dock for repair, warp to various quadrants, rescue some spacemen, have your controls go smacky, see your ship done itself for no reason and collect keys while darting down a space corridor laden with enemies. The game is staggeringly colourful and exhilaratingly quick to boot. Your little ship moves across the screen at speed and aiming can be done using a handy radar that sits at the foot of the screen. *Solaris* is an extremely challenging shooter that boasts some staggering visuals, and while its frenetic gameplay will certainly take some getting used to, it's certainly a stellar and ambitious showpiece from Atari.

"IF YOU CAN PUT ASIDE THE SKITTISH CONTROLS, HEADACHE-INDUCING FLICKERING AND BLOCK-LIKE VISUALS, THIS IS A SURPRISINGLY AUTHENTIC BLASTER THAT GIVES HOURS OF ENTERTAINMENT"

MS PAC-MAN

■ Year: 1982
■ Publisher: Atari Inc

15 After the mess that was *Pac-Man* on the 2600, it's great to see that Atari managed to get everything right for this excellent sequel.

Although to be fair, if we had the alleged six-week programming time that *Pac-Man*'s developers had, we'd have turned out a load of old rubbish as well.

While it's far from arcade perfect – the ghost patterns aren't quite right, there are no intermissions and the visuals are far cruder – this is still a brilliant conversion. Every single maze from the original arcade version is present and correct, it's possible to change the number of ghosts that chase you and it plays like a proverbial dream. In fact, it's the controls that are arguably one of the most impressive aspects of *Ms Pac-Man*.

While the original *Pac-Man* seemed to move around at a whim, taking ages to respond to your joystick movements, *Ms Pac-Man* was a very different experience. You could argue that the constant flickering of the ghosts was annoying, but it's a small price to pay for such a classy conversion.

SPACE INVADERS

■ Year: 1978
■ Publisher: Atari Inc

14 Considering the blissful simplicity of the coin-op original you'd think that *Space Invaders* would be easy to port to the Atari 2600, and it was. Sort of...

While this was nowhere near arcade perfect – there are only 36 invaders instead of the original 55, one of the defence bunkers is AWOL and it's far more simplistic to play – *Space Invaders* on the Atari 2600 is still an excellent shooter that's hellishly addictive to play.

Although it bears little physical similarity to Taito's arcade game, the basic nature is still in place, and best

of all, a staggering amount of different game modes are included – 112 in total. Quite a staggering achievement considering most games of the time managed to fit around 4 to 30 different options on the cartridge.

Moving shields, zig-zagging bullets, guided bullets, a variety of different two-player modes, invisible aliens; the range of different gameplay modes is seemingly endless and will keep you playing forever. The Atari 2600 may not have been able to successfully emulate its arcade peer, but its vast amount of options arguably made it just as good a game.

DEMON ATTACK

■ Year: 1982
■ Publisher: Imagic

13 For those familiar who played Amstar's arcade game *Phoenix*, this horizontally fixed shmup, by Rob Fulop, will seem very familiar.

Taking the controls of a laser cannon, it was your mission to protect planet Krybor by blowing the sprite out of many intergalactic demon birds that braved hovering above your turret. Unlike *Phoenix*, poor 2600 owners got no mother ship screen to vent their frustration on, just wave after wave of jittery winged cannon fodder. The difficulty of *Demon Attack* is taxing at best, especially during the later stages, where shooting at enemies will cause them to break off into smaller, more nimble birds. *Demon Attack* found a release on the Intellivision and the Odyssey and was the focus of some heated legal wrangling between Atari and Imagic. Atari had purchased the home videogame rights for *Phoenix* and disputed that *Demon Attack* shared a few uncanny similarities. The case was settled out of court. Ron Burgundy style with 2600 paddles, bike chains and much staring.

DEFENDER II

Year: 1984

Publisher: Atari

12 After the bitter disappointment that was 2600 *Defender*, Atari managed to get everything right with this far superior sequel. What impresses us most with Bill Aspromonte's wonderful sequel is just how slick it actually is. Everything moves along at a tremendously smooth rate, and the action never lets up for a second. It

certainly takes a while to get used to your craft's handling but once you do you'll be flying over the alien landscape with ease.

If you're looking for an incredibly slick shoot-'em-up that boasts plenty of replay value then *Defender II* can't really be beat. A solid port that captures all the fun and excitement of the arcade original.

KEYSTONE KAPERS

Year: 1983

Publisher: Activision

11 Activision made some wonderfully slick 2600 titles back in the day. The wonderful *Keystone Kapers* is another fine example of the company's brilliance and a superb platformer in its own right.

Taking on the role of a copper, your aim is to simply chase down a prisoner and bring him to justice. It's a fairly straightforward chase but is given depth by having the action take place on four separate levels.

Fortunately your copper has been working out, as the boy in blue is able to run along at a fairly nippy pace and can jump over any objects that get in his way. Best not dilly-dally though, as the constantly decreasing time limit ensures that you're constantly on the move.

Full of character and impressive to look at, *Keystone Kapers* is a wonderfully breezy platformer that constantly manages to entertain. Another direct hit from Activision.

BERZERK

Year: 1982

Publisher: Atari Inc

10 This is the game that Eugene Jarvis found inspiration for his run-'n'-gun classic *Robotron: 2084*. It is, in our opinion, the very best run-'n'-gun on the Atari 2600.

Based on the arcade game of the same name, you play a fugitive trying to escape the most dangerous environment imaginable – an electrified maze teeming with cyclopic robots. Cripes! Despite not really being much to gawp at, the animations in *Berzerk* are splendid; the robot's whirling eye graphics were menacing and really instilled a feeling that they're scanning the room for a fleshy to kill. The AI is also brilliantly naff because you can fry the dopey droids by drawing them into the electrified walls.

Helping to keep the action at a fast pace is Evil Otto, a smiling ball graphic that will chase you around the screen until you eventually make an exit. While the arcade version of *Berzerk* was infamous for 1) appearing in the titles of the film *Crank*, and 2) for making Otto indestructible, the 2600 port allowed the player to blow up the jubilant ball of death, making the game a shade more forgiving and not driving you berserk.

"FULL OF CHARACTER AND IMPRESSIVE TO LOOK AT, KEYSTONE KAPERS IS A WONDERFULLY BREEZY PLATFORMER THAT CONSTANTLY ENTERTAINS"

KABOOM!

■ Year: 1981
■ Publisher: Activision

09

This excellent twitch game from Activision – loosely based on the Atari arcade game *Avalanche* – is basically the polar opposite of a shoot-'em-up.

Rather than avoiding danger; you literally had to try to catch it. Using the paddle peripheral, you had to use buckets of water to sweep up bombs that were dropped by the 'Mad Bomber'. What makes this game somewhat peculiar is that the more lives you lost; the harder the game became. Starting out with three buckets all piled on top of each other; every time you fumbled, a bucket would be docked from your pile, shrinking your avatar and so making your job that much harder to accomplish.

Kaboom! also happens to be an annoyingly hypnotic experience. After the first few waves the game cranks up the speed until you're blissfully aware that your subconscious has booted you off the paddle and is playing the game for you. And yet you stick with it because the game has that annoying 'just one more go' factor that causes you to jump back into it as soon as you spectacularly mess things up.

WARLORDS

■ Year: 1981
■ Publisher: Atari Inc

08

This four player version of *Breakout* is arguably one of the finest experiences that you can have with four people and an Atari 2600.

It is ridiculously simple, wonderfully playable and is blessed with some fantastic computer AI – so even the friend-lacking gamer out there can sample its charms. *Warlords* is simply a last-settlement-standing-wins affair,

and that's basically that. The joy of this game is that you can catch the ball, if you wish, and aim it at whichever friend is currently in the lead, this means you can unfairly team up against mates and bully them out of the game – which causes all sorts of enjoyment. Despite suffering from some rather questionable physics – your ball will fire off in directions that will have you scratching your head, the action is frantic and the game is a multiplayer classic.

MISSILE COMMAND

■ Year: 1981
■ Publisher: Atari

07

Where arcade conversions like *Pac-Man* failed miserably on the 2600, *Missile Command* didn't. It hit its desired target to become a truly astonishing port of Atari's

base-defending classic.

There is, as you'd expect, some scaling down to be found. After all the original *Missile Command* was built from the ground up with chip specific hardware. This Atari 2600 version wasn't so lucky and has to make a number of compromises. For starters, you only got one base to protect, as opposed to the original three, some of the enemies appear to be taking a vacation and there are also limits to the number of missiles you can fire simultaneously.

This version does boast remarkably tight collision detection, and adorable-looking mushroom clouds that pop over. Overall, it's a very decent conversion that's only let down by a lack of trackball support.

FROGGER

Year: 1982

Publisher: Starpath

06 With no scrolling to contend with, the 2600 was always going to be in a great position to take on Konami's riveting traffic-dodging classic.

And take it on it does. *Frogger's* appearance on the 2600 would prove so popular that two versions of the game would eventually find a release on the 2600: the Parker Bros edition and Starpath's 'official' version.

Both iterations are fantastic and both include a forgiving *Pac-Man* physic that allows you to reach the edge of a screen and re-materialise on the opposite side without losing a life. Despite the Parker's port packing a neat 'Fast Frogger' mode, we have to hand the accolade for the best version to Starpath's iteration of the game. If you're lucky enough to ever locate a copy eye-watering visuals, that look astonishing to the original, will be your reward.

YAR'S REVENGE

Year: 1981

Publisher: Atari Inc

05 When we selected the truly shambolic *E.T.* to feature as our Retro Shamer in issue 44 we came under heavy fire for calling the game pants.

Just to reiterate, the entire game is about falling into black holes to rebuild a telephone. Howard's perennial shoot-'em-up is a real showcase of his talents. *Yars' Revenge* shows him summoning some pretty impressive powers from the humble Atari 2600. Notable mentions include the seismic explosions and the hypnotic rotating shield that guards your target.

Widely loved, *Yars' Revenge* is a fantastically atmospheric shoot-'em-up that's annoyingly addictive. And thanks to the sporadic nature of the swirling Qotile and that bloody homing bullet that followed you around, it emits one of the most nail-biting experiences on Atari's console. An absolute must-have for any 2600 collection.

ADVENTURE

Year: 1978

Publisher: Atari Inc

04 It's easy to write off Warren Robinett's *Adventure*. With its crude visuals (your hero is nothing more than a square block), simplistic sound effects and dull-sounding premise – retrieve a missing chalice and return it to your castle – it sounds like one of the most pointless games ever conceived. This of course is completely naïve, as beneath its ancient-looking exterior is a surprisingly complex arcade adventure, the very first arcade adventure, in fact.

Loosely based on the popular text game *Colossal Cave Adventure*, Robinett's *Adventure* is a triumph of design. As you guide your knight around the surrounding countryside you'll find yourself chased by dragons, pestered by thieving bats and negotiating complex mazes, often in the dark. Eventually you'll discover the treasured chalice and must return it to your castle.

While game one on the cartridge is a ridiculously cut-down version of the main adventure, the real meat of *Adventure* is found on modes two and three.

The challenge steps up a gear and with three dragons to battle, a variety of different castles to visit and several mazes to solve. Even when you've completed *Adventure* it never truly ends. Okay, so sometimes the gold key will generate in the gold castle (making it impossible to complete) but hey, that's what the reset button is for.

"WHEN YOU'VE COMPLETED ADVENTURE IT NEVER TRULY ENDS, AS THE FINAL MODE RANDOMLY PLACES ITEMS THROUGHOUT THE GAME WORLD, MEANING NO TWO ADVENTURES WILL BE THE SAME"

RIVER RAID

■ Year: 1982
■ Publisher: Activision

03 We've covered a great many shooters in our top 25, but this incredible effort from Carol Shaw is arguably the best of the lot and thoroughly deserves its place in the top three.

Sitting at the controls of a plane, you're required to travel up the constantly scrolling river and destroy the many enemy craft that inhabit it. Ships, helicopters and fighter jets are just a few of the obstacles that get in your way, and as you continue up the never-ending river everything just gets tougher and tougher. *River Raid* is a constant battle and it's one that never becomes boring, mainly because there's just so much to see and do.

Despite the limitations of the machine, Shaw created an impressive-looking game that featured exceptionally smooth-scrolling, surprisingly detailed scenery and an amazing amount of objects to blow up.

It wasn't just the visuals that were polished though, as Shaw had honed the gameplay until it shone. As your plane fought its way up the river its fuel would steadily deplete. Fortunately, fuel drums were plentiful and flying over them would gradually increase your fuel. What's interesting here though is that Shaw gave you a

choice: either collect that fuel in order to continue your frantic journey, or shoot it down for points. It sounds like a no-brainer but when you consider that destroying fuel barrels granted you more points than helicopters and ships, it suddenly brought a whole new level of strategy to *River Raid*. Did you go for the easy points and hope that you'd reach a new fuel pod in time – as the level progressed they became scarcer and scarcer – or did you simply play it safe and try to travel as far as possible.

Of course, if you opted for the latter, your task was no less difficult, as the further you travelled the trickier the river became to traverse. While you initially started off across a huge expanse of water, the scene soon changes and it breaks up into narrow tributaries that become exceedingly tough to navigate.

Add in that said tributaries often had enemy craft lying in wait for you and the task became even harder. Thank goodness then that collision detection throughout is spot-on and allows you to squeeze through even the tightest of gaps.

River Raid was further testament that Activision was a force to be reckoned with and it should come as no surprise to see its games feature so prominently.

H.E.R.O.

■ Year: 1984
■ Publisher: Activision

02 Aunt May swears by them, Bonnie Tyler was holding out for one, while Enrique Iglesias just wanted to be one. Activision, however, actually made a hero and he went on to star in one of the Atari 2600's greatest games.

Mixing precise control with exploration and the odd bit of shooting, John Van Ryzin's *H.E.R.O.* skillfully mixed together a concoction of different ideas to create a truly outstanding release. Taking control of Roderick Hero, a jet-pack-equipped rescuer, you had to search the caverns of Mount Leone and rescue the miners trapped within. Things are never easy though and cave-ins and a variety of dangerous animals mean that you'll need all your wits about you if you're to reach the final stages.

While the huge caverns are filled with all manner of hazards, Roderick Hero is far from defenceless and has a number of handy items that make negotiating the maze-like caves far easier. As well as a handy gyro-copter, Roderick also has access to a deadly laser as well as a limited supply of dynamite. Throwing down a stick of dynamite allows you to break through some of the cavern's smaller walls (careful you don't get caught in the blast though) while the laser is great for taking care of the many small creatures that get in your way. Should you run out of explosives the laser can also be used to destroy walls, but be warned, it takes a fair amount of time to do so.

And time is one thing you don't have a lot of, as your power supply is constantly falling. Therefore, it becomes a race against time to negotiate the cleverly designed caverns and rescue the poor souls as quickly as possible. Although the controls take a while to get used to, once you've sussed them you'll be negotiating the caverns

with ease, and considering later stages feature volcanic rock that is deadly to the touch, you're going to need all your skills in order to reach the final stages.

Beautifully designed, with detailed visuals and sound effects, *H.E.R.O.* is the game that just keeps on giving. It's rumoured that *H.E.R.O.* failed to sell as many copies as previous Activision titles as it was released the same year as the videogame crash. Hopefully this article will persuade you to hunt it down and discover it for yourself.

PITFALL II: LOST CAVERNS

Year: 1983

Publisher: Activision

01 So here we are then. It's the number one spot, the numero uno, the big cheese, the mac daddy (damn, now we're just getting hungry).

It's certainly not been easy reaching your final decision and no doubt there will be many Atari 2600 fans out there who will vehemently disagree, but try as we might we couldn't think of a more deserving winner than David Crane's stupendous *Pitfall!* sequel.

Everything about *Pitfall II* just oozes quality. Technically outstanding, *Pitfall II* virtually blew away every 2600 game that had been released before it and remains a surprisingly robust platformer. Hardly surprising really as each cartridge came fitted with its own unique circuitry, known as the Display Processor Chip (or DPC). Not only did Activision's chip enable four-channel music, it also allowed for some truly impressive-looking visuals and vertical scrolling, something that didn't feature in the original game.

Enhanced graphics that dropped gamers' jaws at the time, and a unique chip weren't the only differences to be found in the two games, as Crane ensured that *Pitfall II* was a far grander experience than its impressive predecessor. While the loss of crocs, snakes, quicksand and tar pits annoyed many, there was no denying that

the sequel had managed to retain the *Pitfall!* spirit, and then some.

Whereas *Pitfall!* simply required you to recover 32 bars of gold within a strict 20-minute time limit and gave you three lives in which to do so, *Pitfall II* was a far more ambitious adventure that pushed the 2600 further than any other game. As well as recovering the Raj diamond, Pitfall Harry also needs to rescue his missing niece and his cowardly pet cat. Interestingly, Quickclaw (the cat) can actually be seen on the very first screen, but you're going to have to negotiate an amazing set of devious traps and obstacles in order to finally reach him. Although the famous *Pitfall!* snakes and crocodiles were nowhere to be seen, there were still plenty of dangerous animals to be found in the lost caverns. Bats, condors, poisonous frogs and electric eels were just a few of the beasts you had to bypass and while a touch was no longer fatal – you didn't have lives – they were still best avoided. A brush with any enemy would not only rob precious points off you, it would also send you back to the very beginning of the game, or if you had progressed far enough, the last red cross – essentially a checkpoint – that you had run over.

Other new additions to the original *Pitfall!* gameplay included Harry's new-found ability to swim and a handy

hot-air balloon that could be used to reach the top of the cavern. He even had a new climbing animation for when he was descending ladders. Along with those greatly improved visuals, expanded environment and additional beasts *Pitfall II* now had a catchy tune that played throughout the game, a rarity on Atari's console. Another nice touch was that the music would change depending on Pitfall Harry's circumstances. The usual jaunty tune would kick in at the start of the game or when Harry picked up a gold block, only to take on a more sombre tone when he was hit by an enemy and was sent back to a checkpoint.

For all its new ideas and additions, it's the gameplay that makes Crane's sequel such an enduring classic. As good as the original was, *Pitfall II* pushed the envelope further and delivered a game that remains as playable today as it ever was. Difficulty is finely honed, progression is well handled and the lack of a timer means you must explore your surroundings instead of rushing through and making a fatal mistake. *Pitfall II* may well be a technical achievement but that alone doesn't make a game great, it needs many other ingredients. Luckily, Crane knew just what those ingredients were and by mixing them all together he was able to create what is arguably the Atari 2600's finest moment.

“FOR ALL ITS NEW IDEAS AND ADDITIONS, ITS THE GAMEPLAY THAT MAKES CRANES SEQUAL AN ENDURING CLASSIC. AS GOOD AS THE ORIGINAL WAS, PITFALL II PUSHED THE ENVELOPE FURTHER AND DELIVERED A GAME THAT REMAINS AS PLAYABLE TODAY AS IT EVER WAS”

THE STORY OF PONG

IT WAS 40 YEARS AGO THAT A SIMPLE WARM-UP ENGINEERING PROJECT HELPED THRUST A NEW INDUSTRY AND COMPANY INTO THE PUBLIC EYE, FOREVER CHANGING HOW WE VIEW ENTERTAINMENT AND BECOMING THE DIGITAL FIRE FOR THE MODERN CAVEMAN. MARTY GOLDBERG TAKES US THROUGH THE HISTORY AND INFLUENCE OF PONG

They were at a turning point in their lives. Nolan Bushnell and Ted Dabney couldn't stay with Nutting Associates any more – that much was clear. But what were they supposed to do now to get their two-person game-engineering firm, Syzygy Engineering, out on the market?

Nolan found the answer by cold-calling several of the 'old guard' arcade game firms in Chicago. Bally, which had purchased fellow manufacturer Midway three years before, was interested in their videogame technology, but not if the duo was still going to be attached to Nutting.

Making a calculated decision, they gave notice at Nutting and rented a 2,000 square foot front-end office with back-end garage on Scott Boulevard to start up operations. Incorporating the company as Atari, they signed a contract with Bally to design a pinball machine, an electromechanical arcade game, and a video arcade game. Money from the contract would come in monthly, and combined with a coin-op route of pinball machines they had purchased

associate engineer and the stock seemed worthless to me because I could care less. It was a nice token, but not that important to me. I accepted the offer because I thought that it would be fun."

Al had never seen a videogame before, and Nolan got him up to speed by plopping the diagrams for his and Ted's game, *Computer Space*, into his lap. In between looking over the technology, Al also had to pull his weight in the small startup where everyone had a role. Ted's was to build the pinball machine, keep the company's books, manage the facilities, and run the coin-op route. Nolan's job was to be Nolan – look over progress and, as Al puts it, "keep bullshitting" Bally that they were making progress so it would keep sending cheques. Al's role, besides engineering, was to help collect the coins on the route that was helping to keep Nolan and Ted afloat, since they weren't making a salary themselves.

"[Collecting the money] taught me about designing things that work in a public environment," Al says. "When a machine steals your money you feel you have a right to destroy it. So it has to be really well

built, but still be cheap to manufacture. I learned a lot about that from collecting on the route."

Al's conditions were spartan, consisting of a work area with a single old oscilloscope that they all shared. But the fun he was seeking was just about to begin.

Pong begins

It started with a challenge to make a game. Nolan wanted a driving game but had decided that Al needed to warm up with something simple. So Nolan lied to Al, claiming they had a contract with GE for a consumer videogame that had to use very few chips. Thinking back to the Magnavox Odyssey demo he had been to that past May where he saw a tennis game, he decided to tell Al the game was to be an electronic version of tennis. He then proceeded to describe what he saw of Magnavox's game, aiming to have Al tweak it further.

One thing was clear in Al's mind: he couldn't make heads nor tails of Nolan's unorthodox schematics that he'd been trying to study. Nolan had to walk through the basics of the spot-motion circuitry that Ted had

"HE OFFERED ME A SALARY AND TEN PER CENT OF THE STOCK IN THE COMPANY"

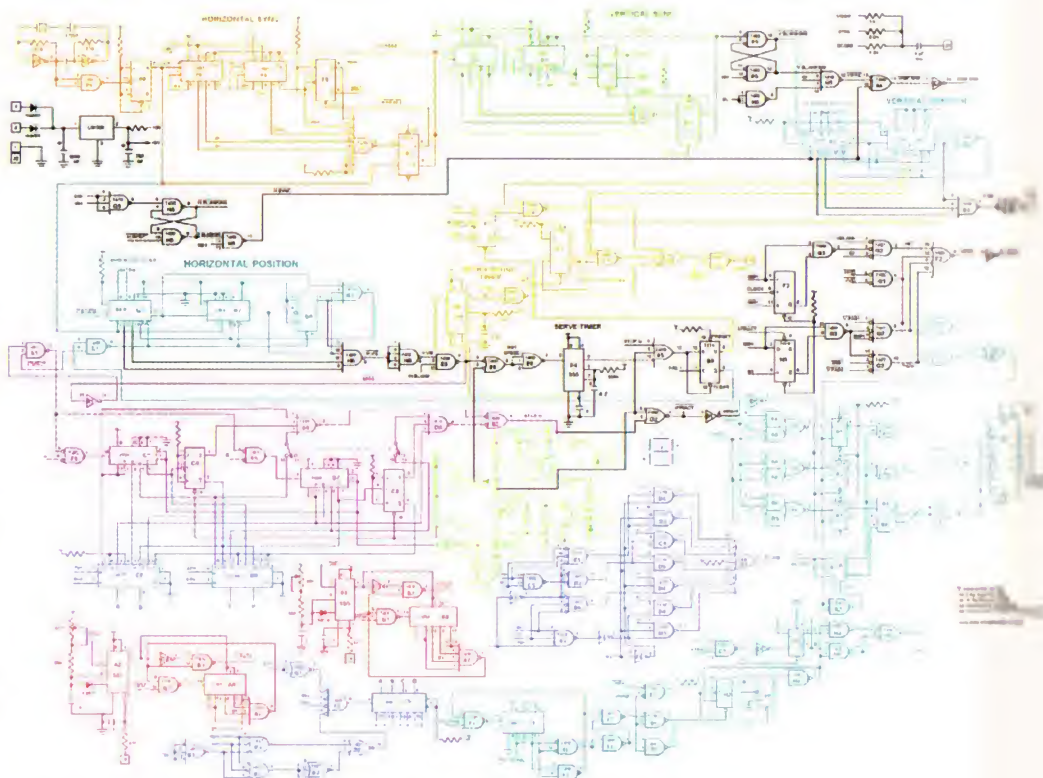

AL ALCORN ON NOLAN'S JOB OFFER

from a fellow former Nutting employee, they had enough to get their small firm up and running and hire some employees. Their first employee was Cynthia Villanueva, a babysitter for Nolan's children who was hired as a combination secretary and work mother for the pair, making sure they would eat during the long hours at work.

It was the second employee, though, that has the real bearing on this story. Al Alcorn had been part of a stable of interns at Ampex's Videofile division when Nolan and Ted worked there.

A burly American football player in high school who decided in college that his future lay in electrical engineering rather than the gridiron, he was on his six-month rotation when he first met Nolan and Ted. By the time they were starting up Syzygy Engineering at the end of May, Nolan paid the associate engineer a personal call.

"He offered me a salary – about \$1,000 a month – and ten per cent of the stock in the company," says Al. "I was already making \$1,200 a month as an

Games in the early Seventies were literally engineered, as they did not use microprocessors or code of any sort. A circuit had to be designed to control each individual aspect of gameplay, as seen here.

designed, explaining how the sync generators work to draw things on the screen.

Al started out by getting a ball moving around on the screen, designing the circuits needed to change direction. This process shouldn't be lost on the reader, who may be more used to today's gaming world where Pong is commonly used as an intro to game programming. Arcade videogames didn't use microprocessors at this time, so there was no game code. In those days, videogames were engineered – no different to any other consumer product like a toaster, telephone or stereo. Game designers in the early Seventies were electrical engineers like Al, creating a circuit for every mechanic that would later be done in software.

When Al went to work on the iconic paddle controls for the game, several ideas came rolling out from the creative part of his brain. Ideas that would become an important part of making it the fun game it is to play to this day.

First there was how to do a simpler version of the 'English' Nolan had described seeing on the Odyssey. Simply a way to make the ball volley off the paddle in unpredictable lines, it makes gameplay between opponents a bit more chaotic, like real tennis. The Odyssey uses a separate 'English' dial control, but Al was able to come up with a simpler method that proved just as fun.

The paddles in *Pong* are 16 pixels high, and by segmenting it into eight sections each, two pixels high, he was able to dictate how the ball angled off the paddle. The catch was the angles were an illusion created by horizontal and vertical speeds. The horizontal speed was set by how many times a volley

» This *Pong* cabinet, signed by Nolan Bushnell, now resides at the Computer History Museum in Mountain View, California.

PONG MEMORIES

My first memories of *Pong* are from when my mum got me a Binatone TV Master MK IV in the late Seventies. It was fantastic – you could actually play games on your TV! It may not look much by today's standards, but it was bloody good fun! So many great memories for a classic game!

» Jim Bagley, Ocean Software

“WHEN A MACHINE STEALS YOUR MONEY YOU FEEL YOU HAVE A RIGHT TO DESTROY IT. SO IT HAS TO BE REALLY WELL BUILT BUT STILL CHEAP TO MANUFACTURE. I LEARNED A LOT ABOUT THAT FROM COLLECTING ON THE ROUTE”

AL ALCORN ON BUILDING MACHINES TO LAST

HOME GROWN PONG

A SELECTION OF THE MANY PONG VARIANTS THAT WERE AVAILABLE ON THE HOME MARKET

MAGNAVOX ODYSSEY

1 Ralph Baer's influential console was created in 1972 and featured two hand controllers. It is the first home example of a console featuring a tennis game, and inspired Atari to create Pong.

HEATHKIT GD-1380

7 As with other systems featured here, the Heathkit is powered by a universal chip, in this case the AY-3-8500. It's a bit of an oddity, and not just due to its radio-like appearance. It only works on Heathkit TV.

SUPER PONG

2 Wanting to emulate the success of Pong in the home, Atari created Super Pong in 1976. Unlike similar home systems of the time, Pong was the only game available on it.

PONG IV KIT

8 Interfab Pong IV Kit existed in three forms: fully assembled, partly assembled or in kit form, requiring full assembly. Released by Interfab in 1976, it played just two games, Tennis and Handball.

WONDER WIZARD

3 General Home Products' Wonder Wizard is an interesting system, as it features a Magnavox Odyssey 300 circuit board in the Magnavox casing. It features a number of games, including a Pong-like version of tennis.

VIDEO SPORT MK2

9 This stylish-looking system is one of the earliest European variants of Pong, appearing in 1974/1975. Created by British retailer Henry's, it included three games: Tennis, Football and Hole In The Wall.

TELSTAR RANGER

4 The Coleco Telstar Ranger was released in 1977 and is a six-game variant of the original Telstar that was released. It came with an authentic-looking pistol and two controllers, with the gun games being Target and Skeet.

TELE-SPIEL

10 We love the look of this, and not just because of its bright colours. It came with a Pong variant, and four additional games could be purchased. There's no scoring system, so players physically score on the controller.

VIDEO SYSTEM

5 This system from First Dimension looked interesting, with the first model released in 1975. The better 1976 variant, shown here, played relatively complex variants of Pong.

HOME TV GAME

11 Another early European system, believed to have been first available in 1974. It played Tennis, Football and Squash and is notable for having a large number of variants.

TELEVISION TENNIS

6 Does exactly what it says on the tin. This home system was created by a small company called Executive Games and was first released in 1975.

BINATONE

12 Distinctive thanks to its orange casing, it's another six-game system. It also includes two gun games, with the gun peripheral having a cool scope.

Images courtesy of David Winter. Visit www.pong-story.com for more great information about Pong.

occurred between the paddles, a feature that Al had added to make it more interesting.

Tweaking begins

"Nolan had told me that it had to be a consumer product," he explains, "so I thought two guys could sit there and play it forever if the ball had just one speed. So I added the speed-up where after a certain number of volleys it would go faster and faster."

Which segment of the paddle was hit would then decide the vertical speed of the ball. Hitting the top or bottom ones would imbue the ball with the highest speed, with each segment closer towards the centre decreasing. Finally, the middle two segments produce no vertical speed change. Combined with the variable horizontal speed, players were now able to create a much more unpredictable, entertaining volley.

Another 'feature' that Al added to the game actually spawned from a defect in the design. The motion of the paddles on the screen is controlled by a special timer chip, the 555, which uses the motion of the spinner controllers as part of its control. A limitation in the chip caused the paddles not to be able to be drawn all the way to the top of the screen, leaving a small gap that a ball can fit through. Instead of coming up with a fix, Al left it in as a stalemate breaker.

Nolan's demand for a low chip count made Al self-conscious through the coming months of the design process. At every turn and request from Nolan to add additional features, Al kept second-guessing how it could be done. On-screen scoring, an on-screen net instead of one affixed to the TV screen, and then probably the most far-reaching request. When Ted and Nolan came to Al asking for the sounds of a crowd, Al declined. There just wasn't a budget.

Nolan wanted cheering for scores; Ted wanted boos and hisses to sound whenever you ended up missing a ball. They instead had to reach a

compromise and ended up with a blipping sound that's now synonymous with early videogames and instantly identifies *Pong*.

By mid-August of 1972, about three months since he started, Al had completed his 'test game'. Nolan was ready for Al to move on to his 'real project', the driving game they'd actually be providing to Bally. The tennis game would just fade off into the darkness. There was one problem, though: it was too much fun to play. Ted thought the game was a great finished product and should be the one they submitted to Bally, and Nolan wanted no part of that. The two had what Ted described as a "knockdown, drag-out" screaming match in each other's faces. The end result was that Nolan agreed to at least test it out.

Going to Al and presenting it as his idea, Ted offered a plan to test out the game at one of their locations, still not letting on that there was no GE contract. Al agreed, still thinking the product had been a failure based on the cost specs he had been given. Ted got a television monitor ready for it, using the same gutting process he had developed when he first created the spot-motion circuitry for *Computer Space*. He then built a cabinet over the following weekend – a half-sized, boxy design for the television and *Pong* prototype to sit inside. Painted in a garish red/orange colour to attract attention, its size ensured that it would have to be propped up on something to bring it to face level. There were no directions on the control panel, no description of what it was about, nothing. A box with a TV screen, two knobs, and a coin box. There was one thing printed on the metal control panel, though. A single word named after the sound of the game: *Pong*.

They decided to place it at their favourite location out of all of them on their coin-op route: a popular tavern called Andy Capps. With seven machines there already, they elected to set the *Pong* prototype on

"WE CUT THE NUMBERS TO BALLY TO ONE THIRD. BALLY STILL THOUGHT WE HAD EXAGGERATED THE NUMBERS"

TED DABNY ON CONVINCING BALLY

Nolan inspecting rows of *Pong* games being manufactured in 1973 at a roller rink. He and Ted needed the space, and this rink proved the right fit.

top of a barrel next to *Computer Space*, which had been an earlier project of Nolan's when he was still at Nutting Associates.

The legend today goes that the machine stopped working because of overflowing coins, but that's not the case of the first breakdown. The first time was because of cheap potentiometers, the electronic component that the spinners are actually made from. They're usually rated for a certain number of turns,

PONG MEMORIES

Pong was truly the first casual game and the first social game. Everyone played it. I mean, everyone. It is ironic that videogames after *Pong* quickly became too complicated for the mainstream public and that we are only now working our way back to mass-market casual and social games.

» Trip Hawkins, founder of Electronic Arts

The games

PONG MEMORIES

What's funny is that I thought *Pong* was old-fashioned in 1982 when games like *Pac-Man* were on the scene, however today I find it a total joy to play *Pong*. *Pong* is the eternal classic that excels because of its simplicity and fun gameplay!

» Mark Bussler,
Classic Game Room

Other companies started entering the market with their own clones of *Pong*, and the market was soon overflowing. This was an ad Atari ran in *Cash Box* magazine at the time to help combat what Nolan called "the jackals".

and AI calculated by the quantity of coins in the box that it was getting far more than what it was rated for. Probably about 100,000 turns by the end of the month, which was unprecedented.

Then, shortly after that, AI got the call for the more famous problem that everyone now knows about. The owner of Andy Capps called him to say that the machine had once again stopped working and that they should come down and fix it because there were lines of people still waiting to play. After heading down and opening the coin box, AI suddenly found an avalanche of quarters flowing out. The only reason the game had stopped working was that the coin mechanism, appropriated for *Pong* from a laundry machine, had overflowed onto the circuit board. A simple fix, but also a promising start.

Nolan and Ted decided to go ahead and build another 12 *Pong* machines in more standard-sized cabinets. Ten would then go out to the other locations on the coin-op route, and they'd keep one at the office. The final one would be sent to Bally to evaluate for the fulfilment of the videogame portion of their contract. Yes, Nolan had acquiesced after the success at Andy Capps.

Success and manufacturing

The numbers kept coming in through September and they couldn't believe it. The new *Pong*-filled coin-op route had almost tripled their earnings. Ted was making enough money to look at replacing his old car. This game was going to be a big moneymaker for Bally – if it ever responded.

Nolan kept in contact with Bally, but it was apparent that it was stalling. Ted explains: "We were getting plenty worried because our future was in Bally's hands. We decided to put together an income report to give Bally some incentive. As we put this report on paper, the numbers looked impossible. We knew that they would think that we cooked the books."

"Since the numbers were so damned high, I suggested that we cut the numbers to Bally by one half. The numbers still looked unlikely, so I said that we needed to go to one third. A couple of the machines were much lower than the others, so Nolan suggested that we not cut those ones so drastically. I said that if we're going to lie, we have to be consistent so we would remember what the lie was. He agreed."

"Believe it or not, Bally still thought we had exaggerated the numbers [for *Pong*]. They were still stalling, but they owned it so we were up a creek. That's when I came up with the idea to get Bally to reject the game."

Nolan, Ted and AI found themselves in Nolan's working out what to do. Bally owned all the rights to *Pong*, since the game had been submitted as the videogame portion of the contract between the two companies. Even if they decided that they wanted to try to manufacture it themselves, they were legally and ethically proscribed from doing so.

Ted further explains: "That's when I said, 'Either we build it ourselves or we go home. I don't want to go home!' We went over what the costs would be and Nolan and AI agreed that we couldn't afford to do it. I echoed my statement and said that we needed to make a decision. I said, 'If we decide to build it ourselves then we can work on how to get it done. If not, we go home.'"

In the end, none of them opted for going home. Ted said he would handle the TVs and cabinets, and AI and Nolan could work on the boards and components. Nolan and Ted then crafted a letter to Bally as well as their strategy for when Nolan went to meet with its management.

In a move that would make Obi-Wan Kenobi proud, they convinced Bally that this wasn't the droid it was looking for. An incredible feat, considering that Bally's subsidiary, Midway, was actually very interested in releasing the game. Nolan managed to talk them out of it by simply playing both groups against each other, claiming to each that the other didn't want *Pong* so that in the end they really didn't. Per Ted's suggestion, they instead offered to replace it with another game, but only if Bally would formally reject *Pong*, returning the rights to Atari. When the formal letter came, the ruse had worked, but better than they had expected Bally had cancelled the entire contract, including the pinball machine.

Ted set about designing the now-famous bright yellow and woodgrain cabinet and getting the television sets they'd need to modify to put in the cabinets. The plan was to make 50 *Pong* cabinets to sell, a modest amount but one that would still strain the small amount of storage space they had in which to manufacture them.

After the design for the cabinet was done, Ted started looking for someone to manufacture them.

**"THAT'S WHEN I SAID,
'EITHER WE BUILD IT
OURSELVES OR WE GO
HOME. I DON'T WANT TO
GO HOME!'"**

TED DABNEY ON PONG'S FUTURE

PONG MEMORIES

All of [Andrew's and my] early programming attempts were to rewrite *Pong* on our own brother's ZX81. I wouldn't be surprised if every games programmer that started in the late Seventies confessed that one of their very first games was a *Pong* clone!

» Philip Oliver, CEO of
Blitz Games Studios

A SHORT HISTORY OF TENNIS

TENNIS FOR TWO

Year: 1958
System: Analogue Computer/Oscilloscope
 William Higinbotham fiddled around with one of Brookhaven Laboratory's early computers for calculating missile trajectories to simulate a crude game of tennis, which set things rolling.

POCKET TENNIS COLOR

Year: 1999
System: NEO GEO POCKET
 While it lacks the structure of *Mario Tennis*, this superb little offering remains our favourite handheld tennis game because it's so much fun to play. Sublime controls and an excellent two-player mode make it a classic.

TOP PLAYERS TENNIS

Year: 1989
System: NES
 This is the earliest example we could find of a celebrity-endorsed tennis game. The players are Chris Evert and Ivan Lendl. It also allows four people to play at the same time, as long as you have the relevant NES adaptor.

MARIO TENNIS

Year: 2000
System: NINTENDO 64, GAME BOY COLOR
 Camelot's tennis game proved that, with the right care, Mario could work in anything. Mini-games galore, excellent gameplay and a crew of Nintendo favourites made *Mario Tennis* one of the N64's best sports games.

SUPER TENNIS

Year: 1991
System: SNES
 Although it's not the most innovative game, *Super Tennis* definitely deserves to be here. It's quite simply the best tennis game ever made, with a masterful selection of shots and incredibly nippy gameplay. Nice Mode 7 court effects as well.

VIRTUA TENNIS 2

Year: 2001
System: ARCADE, DREAMCAST, PS2
 Sega's original *Virtua Tennis* was so good that it became an extremely hard formula for Sega to improve on. It managed it, though, thanks to even more players and an improved campaign mode.

JENNIFER CAPRIATI TENNIS

Year: 1992
System: MEGA DRIVE
 There are lots of tennis titles that focus around classic male players, but this is the only one based on a female tennis star. While it plays a decently, there are more notable titles to feature celebrity endorsements.

OUTLAW TENNIS

Year: 2005
System: XBOX, PS2
 An odd tennis game, as the only endorsement isn't a player but political satirist Stephen Colbert. While it tries to shock with its cast – a PhD stripper, a convict and a Jewish ninja, among others – it plays a rather rudimentary game of tennis.

PETE SAMPRAS TENNIS

Year: 1994
System: MEGA DRIVE, GAME GEAR
 This fun offering from Codemasters featured Pete Sampras and was the first game to utilise the company's J-Cart technology, allowing two pads to be plugged into the cartridge.

WII SPORTS

Year: 2006
System: Wii
 The pack-in game for Nintendo's Wii featured a truly wonderful game of tennis that really came into its own thanks to the motion controls. The sequel in *Wii Sports Resort* was better thanks to MotionPlus control, but the original remains so fun to play.

The games

Happy faces in your waiting room.

In an effort to expand its locations and potential buyers, Atari promoted *Pong* to department stores and doctor's offices. Seen here is a flyer for *Dr Pong* and *Puppy Pong*, which are simply *Pong* housed in a waiting-room-friendly cabinet.

in bulk. After one false start that was too cheaply put together, he found the answer in the form of PS Hurlbut, a local cabinet maker. Ted said they might not be able to pay for them all at once, but the owner said it was not a problem because of their line of credit through a local bank. Then, suddenly, two weeks later, he received a call that the cabinets were ready, to come pick them up. There was no way Ted or Nolan had the transportation, but Hurlbut delivered them – all 50 at once. Atari didn't have the room for all of them inside the small leased area, let alone room to do the work to install the components.

By chance, though, the candle maker next door happened to move out in the middle of the night,

leaving a vacancy. Without asking permission, Ted used a sabre saw to cut a large hole through the wall separating the two properties. Now they had plenty of room to spare!

Ted also used his own money to pick up 50 13-inch black-and-white Hitachi TV sets that were going to be taken apart and used for the monitors inside each *Pong* unit. Costing \$3,000 in total, the investment out of his own pocket was well worth it in his mind. They had a chance to make more money in the long run.

In the meantime, Nolan had a slightly easier job getting the PCB manufacturing going. He literally just walked across the lot from their rental unit to another one where a small PCB manufacturer was located. Though he and Al also tracked down sources for the rest of the parts they needed, Nolan's overall job was... well, nobody really seemed to know.

It was 27 November, and Ted and Al set about assembling the units, as did a few of the other people they had taken on at the time. But Nolan largely stood around, watching while everyone assembled. Ted walked up to him and said: "What are you doing? We're assembling these things; now it's your job to go sell them."

With what Ted describes as a "hang dog" look, Nolan went back to his office to start making calls. The price had already been decided: \$937 per *Pong* unit. Picked by Ted after he saw the number on the licence plate of a car in the parking lot, it put them in the sub-\$1,000 price point they wanted. Nolan returned only an hour later, looking white as a ghost. Three phone calls later, he told

PONG MEMORIES

Pong was such a powerfully influential game that Bill Budge's first Apple II high-res 6502 program was a *Pong* ball bouncing on the screen, and it blew him away. Creating the *Pong* experience himself years after the original appeared was still an event of magnitude.

» John Romero, *Loot Drop*

"WITHOUT PONG, YOU'D HAVE NO COLECO OR NINTENDO ENTERING VIDEOGAMES"

PONG'S IMPORTANCE IS CRUCIAL

them that he had sold 300 units – 50 to one, 100 to another, and 150 to the last. They were in business!

Legacy

While the Magnavox Odyssey and *Computer Space* had been first in the consumer and coin-op industries respectively, it was *Pong* that would really drive the move towards videogames in the public consciousness and jump-start both industries. By June of 1973, Atari had already sold 3,500 units, which was stellar in a time when most runs of traditional coin-op games like pinball were 1,500 units. At the end of its manufacturing life, around 8,000 units were sold. This was all in the midst of an explosion of clones by other manufacturers, including Bally/Midway.

The press jumped on the new medium, whose name still hadn't been defined yet. It could be regularly seen labelled as TV tennis, TV games, *Space Age* games, video action games, electronic games, television skill games, video skill games, *Space Age* pinball and just plain videogames. But Atari's *Pong* and *Pong*-flavoured follow-ups were most assuredly in the front.

Pong reached such iconic status that it has influenced pop culture as well, becoming a recognisable symbol of the Seventies, with many appearances in movies and television shows from that decade onward.

The impact of *Pong* on the industry simply cannot be diminished. It launched the company that was synonymous with videogames and high technology solidified and trumpeted the home videogame industry, launched entire genres that branch from it, like the *Breakout*/*Arkanoid* style of games.

Pong revolutionised the way we look at interactive entertainment. It created an acceptance of the

The inside of the first *Pong*. A simple wooden shelf with a standard 13-inch black-and-white Hitachi that Ted picked up. The prototype *Pong* sits in the bottom of the cabinet.

► Atari's *Pong* may look simple but it's gameplay is truly timeless. A real classic videogame.

amusement industry at a time when it was associated with organised crime and back-room bars, and showed the promise of the future of high technology as it entered the public consciousness.

Without the impact of *Pong*, you'd have no companies like Coleco or Nintendo entering videogames, both of which started with clones of the game. It was Atari's Japanese coin-op division, which started out making *Pong* machines in Japan, that was sold to Namco to become its own videogame division. Likewise, jukebox company Konami was inspired to enter the videogame industry over the success of *Pong*.

With its recognition in museums and archives, *Pong*'s importance to industry and culture has come to its highest level. And now, here we are, 40 years later, paying homage to the game that started as a warm-up and truly warmed up the industry.

PONG MEMORIES

Pong was probably my most desired toy that I never actually got. I loved the game – used to play in arcades – but it was always that little bit too expensive to buy. You can imagine my awe when I actually got to meet and become friends with Nolan Bushnell! Life is funny sometimes.

Ocean Software

PONG SEQUELS

PONG DOUBLES

SEPTEMBER 1973

This was the first follow-up to *Pong*. *Pong Doubles* moves the game into a four-player variant by re-creating the doubles tennis format. Four paddles controlled by four separate spinners create a unique co-operative version of *Pong*. Needless to say it proved to be quite popular.

SUPER PONG

FEBRUARY 1974

This adds three paddles to the player's spinner and random starting points for the ball's serve, giving for more variety to the gameplay. The three-paddle horizontal format was later leveraged vertically in games like Atari's *Avalanche* and Activision's *Kaboom!*

QUADRAPONG

MARCH 1974

This is another move by *Pong* into the four-player realm, which was done to ensure its popular game stayed fresh. In this version, each player guards their own goal with their individual paddle. The player can only miss four times before their goal closes up and they're out.

PIN PONG

OCTOBER 1974

The first pinball videogame, and it was done *Pong*-style. It was still just a ball and paddle, but in this case the flippers were the paddles. There are no real flippers on screen; an image of a paddle angled to the real horizontal one is quickly substituted to create the illusion. Very clever.

TOURNAMENT TABLE

MARCH 1978

This is a collection of all of Atari's paddle-and-ball games in a single cocktail-style arcade cabinet. *Breakout*, *Quadrapong*, *Foozpong*, *Handball*, and multiple variants of *Soccer*, *Hockey* and *Basketball*. Plenty of variety and similar things would soon start appearing in the home.

THE MAKING OF SPRINT 2

AS ONE OF ATARI'S FIRST MICROPROCESSOR GAMES AND THE ANCESTOR OF SUBSEQUENT TOP-DOWN RACERS, SPRINT 2 REPRESENTED A HUGE SHIFT IN ARCADE GAMES. CO-DEVELOPERS LYLE RAINS AND DENNIS KOBLE RECALL FOR US THE BIRTH OF A TRUE CLASSIC

Videogames were going through an exciting change in the late Seventies and early Eighties, with developers using all sorts of clever technical tricks in order to make their hardware sing. We were keen to find out how Atari formed the blueprints for one of gaming's earliest genres - the top-down racer, which would spawn numerous imitators.

What can you tell us about *Sprint 2*'s origins? Where did the concept come from?

DENNIS KOBLE: I can't exactly remember where the game idea came from, except that I didn't come up with it. I was hired to do a job and that's the job they gave me. I recall being handed a quad-ruled pad and becoming immersed in assembly 6502 programming, and I believe the entire game was done in 4K.

The team consisted of myself, engineer Howard Delman, and a super tech, Dan Van Elderen, who later became president of Atari Games. And then there was Lyle Rains, senior game guru/engineer, who had a brilliant sense of gameplay and often made small but critical suggestions regarding how to improve the game.

The facilities were small and old and I shared the front office near the entrance with Howard and Dan. The office was so cramped that if we put our feet up on our desks, there wasn't room left to enter or leave! When it rained, the water would seep under the wall and soak the carpet, giving it a nice mildew smell...

LYLE RAINS: I've no clear memories on the genesis of *Sprint 2* either, but I can guess, with a certain degree of confidence, that it was mostly a matter of Atari never wanting to be too far from the release of a new and improved driving game.

The *Gran Trak 10*, *Gran Trak 20*, *Indy 800* and *Le Mans* games had been consistent moneymakers for Atari and its customers. By 1976, we were working with microprocessor-controlled game systems, and would have wanted an updated product in the category. Although visually related to the *Gran Trak* games designed for Atari by Cyan Engineering, the

electronics system was completely redesigned for microprocessor control.

Since this was one of Atari's first mass-produced microprocessor games, did you find the technology liberating or restrictive? Were there things you had to avoid due to technical limitations?

LR: It was so early in the microprocessor game era that we didn't know what we didn't know. And the processors were so slow and limited that we continued to solve some problems in hardware that would later be handled by software alone. But the key difference was the amount of tuning you could apply to the gameplay that would have been impractical in the hardware-design era. *Sprint 2* was faster and more exciting than its predecessors, because we had more freedom.

"IT WAS SO EARLY IN THE MICROPROCESSOR ERA THAT WE DIDN'T KNOW WHAT WE DIDN'T KNOW"

LYLE RAINS

of previous games, so we kept what worked and changed what didn't. Nobody liked going backwards in *Gran Trak 20*, so we got rid of reverse and went to a four-speed gearbox. This also got rid of the need for a brake pedal, because lifting off the gas was the brake. *Sprint 2* was all about drifting around the track.

As for the timed game, that was the same as *Gran Trak 20*. Lap-based games and lap qualifiers just hadn't occurred to us yet.

OK: The gameplay mechanics were straightforward in those days. You raced around the track and either won or lost and eventually the game timed out. The goal was to give you a couple of minutes of fun gameplay for a quarter. The game options were simple, set by switches in the cabinet. I think we included four coin modes, some timer settings, and a switch-controlled oil slick, which was a little graphic made up of four eight-by-eight sprites that caused you to skid when you drove over it.

SPRINT SEQUELS

Before *Super Sprint* arrived in 1986, there were three other *Sprint* sequels that appeared in arcades. "*Sprint* was done later with minor code changes for its randomised track and single set of controls," says Dennis. "*Sprint 4* and *Sprint 8* were done by Steve Calfee, another programmer at Atari, using my code base." By that time, Dennis wasn't involved, since he'd become manager of the VCS group. "But the game series was very popular, and I collected royalties for years, even though I was in the consumer division. I was the only non-coin-op person to make a quarterly trip to coin-op to collect my cheque, and they always gave me a hard time about that!"

LR: The oil slicks were also present in *Gran Trak 20* on the tracks, they appeared as dark rectangles on the course – we just made them look a bit prettier!

What was the thinking behind the computer-controlled cars, and how did you deal with the AI in 1976?

LR: From a player's standpoint, the addition of computer-controlled cars was a major feature. They weren't truly competitive but added moving obstacles to the racing action, and improved single-player racing. We didn't use the term 'artificial intelligence' for computer-controlled elements at that time, as such concepts were still in their infancy.

There had been a pseudo-random flying saucer in *Computer Space*, and I'd engineered a simple hardware AI in *Jet Fighter* two years earlier. The enemy jet would fly straight, then bank pseudo-randomly. If he sensed you were in the quadrant in which he was aimed, he would fire. It was surprisingly effective. That was my total experience with game AI up to that point.

Rather than have the *Sprint 2* AI cars fixed on rails, we wanted something that seemed less repeatable. I came up with a concept for creating a map of vectors to tell the AI cars which way they should drive. They would align themselves to the current vector and drive themselves around the track in a non-repeating

path. There was a switch you could set that would show arrows on the racetrack, so you could watch the automatic steering in action.

How did you go about creating *Sprint 2's* graphics and sound?

DK: For graphics, I was given a 'standard issue' pen and quad-ruled pad and drew everything, based on the hardware constraints – eight-by-eight sprites, for instance. Artists at the time only did the side panel and control panel artwork – they weren't involved in a game's creation!

The sounds were done by Howard Delman, sitting there with a variety of resistors and a soldering gun. He'd make a beep and I would say, 'That's too high,' so he'd substitute a different resistor and I'd say, 'That's too low,' and so on – very high tech!

That's a fantastic piece of trivia Dennis. Finally, how did you go about testing the actual game and its gameplay?

LR: We'd spend hours playing these games during lunch hours and after hours. Standing on one's left foot for long periods of time – as your right foot was on the pedal, left hand on the wheel and right on the gearstick. Thankfully, I still have my original hips and knees, so I guess it wasn't too bad!

The neon-coloured *Sprint 8* added complexity in the form of more cars, tougher tracks and a brake pedal.

THE MAKING OF ASTEROIDS

UNDER ATTACK FROM TAITO'S SPACE INVADERS, ATARI RESPONDED WITH ITS OWN TAKE ON INTERSTELLAR COMBAT. TO MARK ASTEROIDS' 33RD ANNIVERSARY, PAUL DRURY DECIDED TO SPEAK TO ED LOGG, HOWARD DELMAN AND LYLE RAINS ABOUT THE GAME'S CREATION AND ITS SUBSEQUENT IMPACT ON VIDEOGAMES

IN THE KNOW

- **Publisher:** Atari Inc

- **Platform:** Arcade
- **Year released:** 1979
- **Genre:** Shoot-'em-up
- **Expect to pay:** £500+ (\$1000+)

It's late-summer 1979 and Ed Logg is preparing for a trip to Old Sacramento, California. He packs the retrofit kit for Atari Football, designed to upgrade the plays and prolong the game's arcade life. Joining him on the journey is colleague Collette Weil, but Ed decides to take another companion along for the ride: the project he's been working on since the spring.

Once at the arcade, his baby is carefully placed among the rows of blinking cabs. There's no fancy silk screen and the cabinet art is incomplete but the lighted panel clearly displays the name of this newborn: *Asteroids*. The proud father stands back and waits.

"A guy walks over and puts in his quarter," smiles Ed, "and he died three times in about 20 seconds. Then he reached out and put another quarter in. I thought, okay, if he's dying three times and still putting in another quarter, he must think it's his fault, not that the game has got it in for him. He died again, almost instantly. He put in quarter after quarter after quarter..."

He was to be the first of many. *Asteroids* epitomised the 'easy to learn, difficult to master' philosophy of game design and Atari managed to shift a staggering 75,000 units, making it its biggest selling coin-op. "I heard people saying we only made about half of the machines out there," adds Ed. "I've certainly seen counterfeit boards..."

Getting started...

Success breeds imitation, though the journey to that first field test in Sacramento actually began almost a decade before, thanks to a little inspiration from the daddy of all space shooters. "I'd played four-player *Space War* back in the early-Seventies on a PDP machine in the Stanford Research Lab," recalls Ed. "Down on campus in the Stanford Forum, they had two machines linked up and you could play for a quarter. Was I any good? Oh no! The other guys would cream my ass over and over again."

Ed poses with a special version of his famous creation.

"I SUGGESTED THE ASTEROIDS IDEA MORE AS A CREATIVE EXERCISE THAN A FULL-BLOWN PROJECT"

LYLE RAINS ON WHY EXERCISE IS GOOD FOR YOU

Rock on - asteroids sequels

ASTEROIDS DELUXE 1980

Dave Shepherd took Ed's code and added a shield and new enemies. Ed: "I was busy being a supervisor and had no involvement. I find it a little too hard." We agree. The killer satellite is just vicious.

SPACE DUEL 1982

A colourful reworking by Owen Rubin, with inventive co-op play and wonderful spinning shapes. Ed: "My initial reaction was that it was very abstract, perhaps too abstract for the casual player."

BLASTEROIDS 1987

Ed Rotberg added power-ups, ship morphing, branching levels, bosses and the ability to dock your ships in multiplayer for added firepower. Best played on an original cab with spinner controllers.

Though no maestro on this makeshift multiplayer cab, Ed knew what made a good game. His work on *Super Breakout*, released in 1978, proved he knew how to revisit an idea and add his own unique signature without losing the original appeal. But when his boss, Lyle Rains, called him into his office the following April, it was to discuss a game's failure to launch.

"Lyle was talking about an older game I remember seeing once and playing but it was just not fun," recalls Ed. "You were trying to shoot the other player but this asteroid was in the way. Players tried to shoot it – I know I did – even though it couldn't be destroyed. He said everyone just seems to shoot the rock, so let's create a game that lets you blow it up."

"I don't really remember what that old game was," explains Lyle of that pivotal first meeting. "It may have been something I had seen in the labs and subconsciously picked up on the asteroid theme. I think of *Computer Space* as being more of the inspiration for the two-dimensional approach. You see, the biggest hit videogame at that time, perhaps of all time, was Taito's *Space Invaders*, which was predominately one-dimensional player control – left and right – with all the threats approaching from above. It was basically *Breakout* with moving bricks and a gun, instead of a ball and paddle. I was seeking a more satisfying two-dimensional game with a similar addictive gameplay theme of 'completion': eliminate all threats. I believe I described the concept to Ed in a few sentences: little

flying ship as in *Computer Space*; big rocks bouncing little rocks; fly and shoot till they all go away. There was no great detail."

Though both men quickly agreed on the basics of the gameplay and indeed the name *Asteroids*, which emerged at this concept stage, they initially disagreed on the format of the project. "Lyle wanted to do it on raster and I said no, no, let's do it on vector," says Ed. "I'd had some experience of working with vector technology. The higher resolution meant you had more control of where you were aiming, not just this blob."

Lyle chuckles: "Ed wanted to fool around with the new vector, or XY hardware before starting his next project. I suggested the game idea more as a creative exercise than a full-blown project. Obviously it took on a life of its own."

"SOMEONE MADE IT
SO YOU COULD BLOW
UP THE OTHER GUY'S
PLANETS. SUDDENLY
IT WAS FUN"

HOWARD DELMAN

Enter Howard Delman

And the giver of life was hardware engineer Howard Delman. Howard had worked

on many of Atari's post-*Pong* successes, including *Super Bug* and the first simultaneous co-operative arcade game, *Fire Truck*. Game development in those pioneering days of the mid-Seventies was not clearly divided into software and hardware roles, meaning that Howard had a handle on both of these emerging fields. Having joined Atari in 1976, he also remembers a project that had been floating around for quite a while.

"There was this old game that had been worked on for a long time because no one could quite make it fun," he laughs. "It was originally called *Cosmos* and then became known as *Planet Grab*, a two-player game

The modified Lunar Lander board created by Howard, which Ed used to develop *Asteroids*. The smaller board at the bottom contains those 13 sounds.

where you were trying to claim planets in space. The more you claimed, the more you scored, and you could steal planets from your opponent, too. As the game was being tweaked and people were trying to make it fun – because it really wasn't fun – someone made it so you could blow up the other guy's planets. And suddenly it was fun. Forget trying to steal his planets, just blow them up. You can see where this was heading... When they saw the vector hardware we were working on, they said 'Oh my God, that would be great for *Asteroids*'. Ed must have been the third programmer on that project. He came to me, I hooked him up with a board and he got to work."

And Howard still has that very board in his workshop, a mass of chips and wires and hand-scravled notes. He's clearly proud recalling the story of how he came to be in charge of handling Atari's first steps into the shining light of vector game development.

"In early-1978, vector games began to emerge, but not from Atari," he begins. "Atari had a research-and-development group in Grass Valley. They came up with an XY display system, and came down to show it to us. It was really cool and we wanted it. They left it with us but it wasn't done, nor was it a platform to do games on. It was the basic hardware concept and I was given the task of turning that into something we could use for a game. It was like I took this rough bit of clay and made it into something real."

Howard was tasked with not only shaping this fascinating technology into something useable, he also had to decide on a game idea to showcase this great leap forward. He settled on *Lunar Lander*, which became Atari's first vector game, released exactly a decade after the historic moon landings. He was joined on the project by Rich Moore and also one Ed Logg, who worked on the distinctive alpha-numeric character set used for the on-screen text and scoring. Thus when Ed received his customised Lunar Lander board, bolstered with extra RAM and some bespoke 'jumps and cuts' from Howard, he had some knowledge of the new hardware. "Man, that thing was tiny," chuckles Ed. "This little four-by-four inch board with five buttons and wires coming off it, linked up to a screen. I started by just getting the ship [to appear] on screen. I wanted to see it flying around..."

Friction or no friction?

Ed had toyed with having no friction to decrease the forward movement of your ship and with no inertia at all (which made the game too easy) before arriving at his happy medium. It was typical of Ed's approach to

the game's development: experimenting with different settings, many inspired by those early battles on *Space War*, to see which delivered the best experience and always on the look out for fortuitous side effects.

"It was all ad hoc at this point," explains Ed when we asked him about those early days on the game. "There was no design document. How did I get those cool vapour trails? That was just a property of those old monitors. They have phosphor and phosphor glows. You put that much electrical excitement into the phosphor,

"I STARTED BY JUST GETTING THE SHIP [TO APPEAR] ON SCREEN. I WANTED TO SEE IT FLYING AROUND..."

ED LOGG

Designing the large saucer wasn't proving straightforward...

it takes a while for it to cool down and not glow, so it seems to leave this trace behind it."

With your ship in motion, Ed sketched out different asteroid shapes and had them drift across the screen in increasing numbers. As you blasted them into smaller pieces, strategies began to emerge. Should you concentrate on the smaller rocks or take out the largest first? Should you stay put in the centre of the field or weave through the debris? The former felt like the safest option.

"I always wanted two saucers," he recalls. "A big one that fired randomly like cannon fodder to get you used to the concept that when you got down to fewer rocks, a ship was going to come out. The little saucer was about making you move. Run away, you're going to die if you stick around!"

Players started to develop a love-hate relationship with that little blighter. They loved the 1,000-point reward for shooting it, but cursed its accuracy and increasing speed. Ed also employed a timer that steadily decreased, meaning respite between saucer attacks became shorter. "I wanted to discourage you from not shooting stuff. Get rid of those small rocks so I can send a new lot of bigger rocks out there, because more stuff on screen means more chance of an unfortunate collision."

Of course, if you were really in a tight spot, you could hit hyperspace and take your chances. On re-entering the playfield, there was a random chance of your ship exploding, its three constituent parts torn asunder and gently fading in one of gaming's most lonesome deaths. "You know, I should have put some algorithm in so that

Send in the clones

MOONS OF JUPITER (VIC 20)

An impressive effort for the expanded Vic and much better than Simon Munnelly's version for Bug Byte, famously described as "a pile of wank" by Jeff Minter.

METEORS (BBC MICRO)

Acomsoft had a knack of producing superior arcade clones and this had schoolboys praying for wet lunch breaks so they could play it on the school's computers.

ASTEROIDS (ATARI 5200)

The VCS version was passable given the limited hardware, but this upped the ante with a smoother, more authentic experience.

MINESTORM (VECTREX)

Okay, we're pushing it here as this doesn't even feature any rock blasting, but it's clearly inspired by *Asteroids*, has beautiful vector graphics and is utterly ace.

The games

if there were lots of rocks on screen you didn't have much chance of blowing up, but with only a few it was a much higher chance," concedes Ed. "And I still have regrets about the placement of the hyperspace button. It should have been nearer my right thumb, so I didn't have to take my hand off thrust to hit it. You know, with hindsight I should have put a shield in instead. If you got hit it was decreased so you had a few chances. That would have given you some more strategy..."

It's the only time Ed questions his design choices, but then he was getting positive daily feedback from his peers. The Atari labs were open-plan affairs, long halls with room for two or three games in development at any one time. Half a dozen staff would be based in each room, and engineers would wander between labs, passing comment and stopping to play as they went.

"Some engineers walking by would see a couple of asteroids floating across my screen and start humming the tune to Lawrence Welk's Tiny Bubbles just to tease me," chuckles Ed. "A lot of colleagues would come by and ask 'when are you leaving?' 'When can I play this game?' And you realise, okay, that's a good sign... Management would come in and check on progress. Lyle was certainly interested. He was, like, let's do a focus group, let's do a field test."

Yes, feedback from outside the company was overwhelmingly positive, too. Atari had organised two focus groups in June 1979. On the 14th, they gathered together seven older players, veterans of *Space War*, and then on the 20th they tested *Asteroids* on nine

children aged between 15 and 17, all of them were *Space Invaders* fans. Ed and his fellow engineers observed proceedings through one-way glass and player comments were noted down meticulously. Ever the archivist, Ed has held on to these four pages of detailed feedback and it's fascinating to read how players first struggled to get to grips with mechanics like the thrust button, requesting a joystick instead, and how the younger group, accustomed to taking shelter behind a base in *Space Invaders*, noted that you don't get a break in this game.

Ed is more circumspect when it comes to the value of these written responses. "I just look at their play and see what's going on. I always believe that if they don't get wowed immediately, you have a problem."

Players also commented on the way the sound effects built the tension, something Howard is especially proud of contributing. "That thump, thump, thump... I was really trying to do a heartbeat," he explains. "I sensed as the game sped up and you became more tense, your own heartbeat would speed up and I really wanted to keep them in sync. We didn't have sound chips back then so I created a hardware circuit for each of the 13 sounds by hand and wired them onto Ed's board myself."

Success story

Such was the intimate nature of creating videogames in those frontier days, and *Asteroids* stands as one of the period's crowning achievements. Released in November 1979, it went on selling for years, earning Atari an estimated \$150 million in sales and a further \$500 million in revenue.

While nothing can truly detract from the game's enormous success, issues did arise post-release. Some were clearly technical: accumulate too many extra ships and the game slows to a crawl, and on some machines,

Ed's original sketches for the different rock shapes

Centipede was released in 1980 and was another hit for Ed.

Scott Safran, whose *Asteroids* record stood for 27 years.

TURTLE POWER

In light of its huge success in the arcades of the time, it seems surprising that Ed Logg never decided to revisit *Asteroids* nor did he produce

another vector game while he worked at Atari, or any other videogame company. He cites the unreliability of the colour vector technology and his desire to work on something new, though he does reveal the little-known tale of *Turtleroids*. "Every year, Atari Coin-op had an off-site brainstorming session where we discussed new game ideas," he tells us.

"For many years the idea of Turtle Races was proposed. This was a game where you raced your turtle by continuously increasing your voice to get your turtle to move. Increasing too quickly caused the turtle to go into its shell for a while. The idea was always shot down. I'm not sure if we turned every game idea into turtle this or turtle that, but one year Frank Ballouz got up in front of everyone and said 'no more turtles!' Of course, we took it as a challenge. We had waiters bring drinks with wind-up turtles in and did everything we could think of in the way of turtles. Someone suggested we change the *Gold Asteroids* in the lobby of Coin-op Engineering in Sunnyvale to have a turtle instead of a saucer, so I changed the graphics and burned a special program to do this. Hence, *Turtleroids*."

ASTEROID MEMORIES

"Asteroids was being developed in a lab near mine. I used to go in and play late at night, sometimes until I filled up the high score table with my initials. Ed Logg would come in next morning, reset it, work on the game and come in the next day to find 'ORR' was in every spot on the table again. So he put in a check for 'ORR' and all other combinations of my initials so they'd be replaced with his. I sent a note telling him there was a bug till he told me what he'd done..."

► Owen Rubin
Creator of Space Duel and Major Havoc

if you got down to just your ship and a single asteroid, the display would fade out. "That's the spot killer," declares Ed.

"If the game dies, the vector beam would just point at wherever you last pointed it and burn a hole in the screen," he continues. "We had a piece of circuitry so that if you don't move the vector enough it shuts it down. I wasn't given any technical numbers, so I put the score at the top and the Atari copyright at the bottom and thought that, along with the ship and at least one asteroid, that would be enough to disable the spot killer and the video display wouldn't be turned off... turns out it wasn't. As for the slowdown, if you have hundreds of ships, the game can't draw everything at 60Hz per frame. I wasn't clever enough to limit it to ten ships or something. Anyway, I thought Mr Bill would come out and blow you away..."

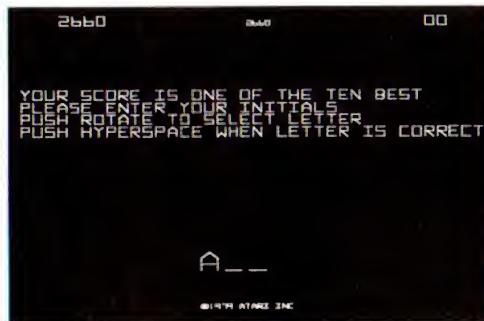

The fact that Ed Logg received a cease and desist letter from their copyright holders, despite there being no reference to the Play-doh pair in the game itself, is an

ASTEROID MEMORIES

"Asteroids was my first experience of videogames. I did house sitting for some friends and they happened to have a machine. I'd play it when I was there and thought it was kinda fun and when they moved they gave it to me as a gift. Years later, I was introduced to Ed at a party by Ed Rotberg who said he'd like to introduce me to the best. No, I was not a groupie! I think Ed was supposed to sign my control panel. He still hasn't got round to it."

► Irene Logg Wife of Ed Logg

Ed took the idea for a high-score table from Exidy's *Star Fire*.

indication of how *Asteroids* had entered popular culture. And that was partly due to Mr Bill not doing his job...

"Originally, the small saucer used to come out and shoot instantly," explains Ed. "If you were right next to him he'd nail you. People said it wasn't fair, so I said okay, I'll give you a second before he takes his shot so you can see where he's at. Unfortunately that opened the big fat window to lurking."

The lurking factor

Ah, the ancient art of lurking, where the proficient player leaves a solitary asteroid on screen and then

hunts saucers for hours, sometimes days, accumulating mammoth scores. It reached its zenith in November 1982 when 15-year-old Scott Safran played a single game for an entire weekend setting the current world record of over

41 million and the widespread use of the technique led many arcade owners to complain about these marathon game sessions.

"What they didn't see was that some could play that long but a lot of other people would try," notes Ed. "That really contributed to both the game's popularity and its longevity. We actually made a new chip to prevent lurking, but a lot of operators found that with it their earnings went down and wanted it put back to the old way. Asteroids would have been successful anyway, but lurking became part of its lore..."

"Sure, there were those who could play forever, but the average player always felt that his failures were his own, that the game was fair, and he could do better next time," adds Lyle. "I think the 'secret' of *Asteroids*' phenomenal success was Ed's near-perfect tuning of the difficulty."

"It came out at a great time, too," says Howard. "Arcades were springing up everywhere. The industry was hot back then. And *Asteroids* is a classic man-against-machine game. It was simple to learn, obvious what you had to do and you could improve quickly, but however good you got, the game was always one step ahead. I used to get into fights with marketing guys who wanted games with more colour, more things on screen, things to be more lifelike. I'd say it was all about gameplay, how fun something is."

Ladies and gentlemen, we are still floating in space...

Ed in 1983, after *Asteroids* and *Centipede* but before *Gauntlet*...

An arcade flyer for the fancy cocktail cabinet.

ASTEROID MEMORIES

"When I saw *Asteroids* at an AMOA show in Chicago, I thought, 'why didn't I think of that?' Its strength was that it allowed you to work out your own ways to win the game. Every player was free to break rocks and shoot saucers any way they pleased. It was an inspiration to me and to decades of game designers. When I was briefly working for Gremlin/Sega, the team

► Tim Skelly Vector Game Pioneer at Cinematronics

there created a variation on it called *Space Meatball* or *F*** Your Buddy*, depending on the prototype. My point is, flexibility is fun, and Asteroids introduced flexible gameplay."

THE MAKING OF MISSILE COMMAND

VIVID NIGHTMARES, ERRANT MISSILES AND LIVING UNDER THE THREAT OF NUCLEAR WAR WERE JUST A FEW OF THE OBSTACLES THAT DAVE THEURER AND RICH ADAM FACED WHILE CREATING MISSILE COMMAND. DARRAN JONES INVESTIGATES FURTHER...

Dave Theurer is not an easy man to get hold of. The genius behind such arcade delights as *Tempest*, *I, Robot* and *Missile Command* is fiercely protective of his private life, so much so, in fact, that it's taken eight long years of gentle

coercion and downright pleading for him to finally commit to an interview about one of the industry's most iconic and important arcade games. Still, when you consider the sheer pedigree of Dave's title, the long wait has definitely been worth it, with the

precise controls and intense pressure the game offers remaining just as refreshing today as the first time you dropped 10 pence into it.

One of the most interesting facts about *Missile Command* is that while the gameplay mechanics are all Dave's, the concept itself actually came from higher up within Atari. "I remember my manager, Steve Caffey, told me to create a missile defence game wherein the player would defend against incoming missiles, which could be seen on a radar display," confirms Dave when we quizzed him about *Missile Command*'s origins. "We took it from there, tossed out the radar screen and added cities, missile bases and so on."

It's a somewhat inauspicious start for one of the most iconic games of the Eighties, but with the constant threat of the USSR and nuclear war being high on the agenda, it's hardly a surprise that the concept had germinated in the mind of Atari (coin-op) president Gene Lipkin. The bleak link became even more obvious when names were being thrown about for the new project, with *Missile Command* being just one of the possible choices. "Some of the names I recall included *Missile Command*, *Ground Zero*, *The End* and *Armageddon*," continues Dave. "There were various pro and con reasons given for each name suggestion, but recognition was a key concern. Lots of people don't know the meaning of 'Ground Zero' and 'Armageddon'. I don't recall being too bleak as a factor. As I recall, Gene Lipkin suggested the name *Missile Command*. There was a general consensus that that was a really good name, so we went with it."

While the concept itself had been born from the Cold War threat, Dave didn't want to use *Missile Command* as an excuse to glorify something that, at the time, was considered a very real threat. "I wanted people to become aware of the horrors of a nuclear war. I didn't want to put players in the position of nuking entire cities as entertainment, because it would desensitise them."

"I DIDN'T WANT TO PUT PLAYERS IN THE POSITION OF NUKING CITIES AS ENTERTAINMENT"

DAVE THEURER

from such horrors," he explains. "However, a defensive position was acceptable, since what's nobler than saving 10 million people from annihilation? The final lesson, though, is that nobody wins in a nuclear war, and that's why we have 'THE END' explode to fill the screen, after all the cities are gone."

It's something that Rich Adam, *Missile Command*'s junior programmer, also touched upon when we asked him about the potential controversy that *Missile Command* might have attracted at the time. "I didn't feel as strongly as Dave, but I certainly did not want to go into something that would simulate a true, aggressive World War III scenario," he begins. "We touched on it to a point, but our concept was always [that] we're blowing up pixels. It's an abstract, conceptual game. It was certainly in our collective minds, but it was not something that dissuaded us or diverted us from trying to make something fun."

Despite the general concerns that were connected to *Missile Command*, Dave, Rich and the rest of the team remained resolutely excited about the project. After all, this was the beginning of the videogame industry, and it

was an incredibly exciting time for everyone involved. "During the first few years, we felt like pioneers," recalls Dave with an obvious sense of pride. "There weren't many [video] arcade companies at the time. There weren't many game development tools either. We had to develop most of them in-house. I'm not sure we thought about it that much, though. Mostly we just thought about how we could make our games more fun to play."

It's a sentiment that Rich wholeheartedly agrees with: "It was an outstanding environment to work in and we were lucky because we were filling the void. Every idea was fresh and new and hadn't been tried before, and that was really fun. Nowadays it's very hard to come up with something novel and different."

As with many of Atari's games, *Missile Command* was built from the ground up, meaning that Dave and the rest of the team didn't have the benefit of using an existing engine, something that is commonplace in today's industry. "You were always bringing out new hardware in that day and age," explains Rich, "so that was one of the key difficulties faced with new projects." The constant creation of new custom-built technology also meant that there was a strong relationship between Dave and the rest of the hardware team while *Missile Command* was being created.

"The hardware designer designed the custom hardware just for this game," explains Dave about *Missile Command*'s early development. "He knew that the bottom portion of the screen needed more colours for the cities, bases, land, etc. No other game, except for a possible sequel, was planned for this hardware. The hardware designer, Dave Sherman, was excellent, and quickly came up with a design, which was wire-wrapped for development purposes."

It was at this point that we were keen to find out if any other system other than a trackball had been considered when *Missile Command* was first pitched. "My recollection is that it was going to be a trackball from the start and it never deviated from that," confirms Rich. "From the moment we implemented it, it was pretty obvious that the trackball was optimum." "We were using trackballs in a lot of our other games at the time such as *Soccer* and *Football* before *Missile Command*," continues Dave. "It seemed like a good match, so a trackball was planned from the beginning."

A WORD FROM LYLE RAINS

We managed to speak to Atari's former senior executive about the popularity of *Missile Command*, and here's what he told us.

"Dave Theurer, as was also the case with *Tempest*, did a fantastic job of tuning the pacing of the game and making the controls responsive.

"Atari certainly did not shy away from battle simulations in our products, although we avoided direct bloody violence on human avatars and mobiles for about two decades. But the world in 1981 was still involved in the Cold War. The idea of nuclear holocaust on cities added an extra edginess to *Missile Command* that resonated with some folks as being a bit too close to home. One could speculate that, as part of the popular culture of the Eighties, *Missile Command* even had some subliminal influence on defence policy-makers, as they contemplated the so-called 'Star Wars' missile defence system. If they had actually played the game, they would have known that you always ending up losing."

The instruction manual for the Atari 8-bit. You just don't get artwork that looks like this anymore...

The games

While the trackball easily made the transition from prototype to final games, many other aspects of *Missile Command* weren't quite as lucky, with numerous ideas being dropped during the game's gruelling six-month development period. "When I was first creating the coastline you were defending, I pathetically tried to create a Californian-looking coast that turned out to be awful-looking," recalls Rich. "Lyle [Rains] was the one who eventually came up with the fortress-looking cities that you had to defend."

The ability to blow up real-world cities, even if they were depicted by simple pixels, was soon ditched, which in turn helped distance the game from any possible real-life connections. There were plenty of other ideas that were tested, but they too quickly fell by the wayside, as they just didn't appear to be suitable. Dave reveals some of the other ideas that were implemented at various stages of *Missile Command*'s development and goes on to explain why they were eventually ignored: "Submarines would pop up and shoot missiles, which didn't make sense, as every other threat was coming from the sky. Railroads hauled missiles between the cities and the bases, but it [was deemed] too complicated for players. There were programmable names for the cities, which made it more relevant for players in areas near the named cities, but less relevant

for players out of the area, but it was too much work for operators to program in the cities' names. There was also a giant physical display above the monitor containing flashing lights, status indicators and other elements. It was too expensive, too hard to maintain – light bulbs too hard to replace – and too hard to play the game and watch this external display."

In addition to numerous gameplay changes, *Missile Command* presented plenty of technical challenges for the developers, many of which were being encountered for the very first time, which was hardly surprising at it was still the start of the Eighties and gaming itself remained relatively new. "The entire program had to fit into approximately 12K and it was written in assembly language," recalls Dave about one of the annoying issues he faced while he was working on the game. "We also had to come up with lightning-fast methods for drawing lines and circles in real-time so that motion would be smooth, and we were constantly working within the hardware limits: the narrow bottom section at the bottom of the screen for land, cities and missile bases had more colours than the rest of the screen."

Rich remembers how the large number of on-screen missiles and smart bombs that the game had to handle also ended up proving to be a problem for the trailblazing pioneers: "Dealing with the new hardware and making

sure that it was up and running and good to go was hard enough, but in terms of development, creative and fun factor it was probably those smart bombs." He continues: "It was just their behaviour. I think a lot of what they did was targeted to a specific city, but they avoided and tried to go around and would use colour to detect in their near region to decide if they were going to plough into a bomb or an explosion area. In that day and age we were trailblazing, but in today's world they are now trivial problems. Getting them to do the right thing and behave intelligently had less to do with time on screen and more to do with the avoidance of getting blown up."

Despite various kinks, Rich feels that the creation of *Missile Command* remained a fairly organic experience for the most part and has many fond memories of working on it. "We did the original incoming missiles and that was cool but not enough, and so we added the satellites and the planes and the things that dropped them. That was more and better but maybe not quite enough, and so we added MIRV missiles, and that was more and better but not quite enough, and then we added smart bombs and that turned out to be enough. And that's really the kind of evolution of how games are created. You take the core of what you're doing, you make that and see if it fits. It was such a

Above and left: There was assorted memorabilia created for *Missile Command*, including an album, a collector's pin and even an audiobook set.

The trackball was essential to mastery of *Missile Command*. A joystick would never allow you to deflect incoming missiles on later stages.

Dave kindly supplied us with this image of the original top that was considered for *Missile Command*. The expense and maintenance of the lights coupled with the distraction it caused meant it was quickly dropped from the final game.

simple concept, and the additions that we made were so simple, that it became one of those games where everything kind of fell into place."

With a prototype finished, it was time to put *Missile Command* on its all-important field test. This was a crucial time for any new game, as the amount of coinage that was pulled in would always decide if there was any point in finishing the project. Even before the field test, though, Dave was convinced that they had a hit on their hands: "I'd be asking co-workers to step back from playing the development prototype so that I could continue working on it," he recalls.

Rich was also pleased with how the field test was received, and, like Dave, he was convinced that they stood a far better chance than other games. "You have to realise that this was one of the first colour games, so it had this gigantic advantage over all its competition," he begins. "I remember some young guy who was probably in the military. He was looking at the game and he had simplified technology into thinking that everything was simply a new chip. He had this unabashed excitement and enthusiasm and was like, 'Oh, man. Look what's in that new chip!' His reaction on test was basically saying: 'Look what technology is bringing to me.'"

After its successful field test, *Missile Command* rolled out into arcades, quickly going on to become a

**"I'D BE ASKING
CO-WORKERS TO STEP
BACK FROM PLAYING SO
THAT I COULD CONTINUE
WORKING ON IT"**

DAVE THEURER

massive success for Atari; although the game's gruelling schedule did leave its mark on Dave, who suffered from regular nightmares about nuclear attack for several months during and after the game's development. Despite those nightmares, Dave remains incredibly proud of his work on *Missile Command*. "We saw co-workers' excitement with it when they came into the lab to play it during development. We had developers from the Atari VCS system that would drop by – they were in the same building – and play it for hours in our

lab. We saw the players' excitement when we put it out on its first field test. We saw collections in all the field tests. It was a very positive experience from start to finish."

Rich is also pleased with the way the game turned out, citing the power it gave you as one of the reasons for its enduring

success. "It's a good feeling to have control over an incredibly complex machine, to have a machine give you that gratification of controlling such a complex piece of equipment for a quarter is a hell of a bargain. Power and ego is fed by that, so that's what we were selling and, to a degree, what videogames continue to sell."

Special thanks to Dave Theurer and Rich Adam for their precious time, Martin Goldberg for additional advice and pictures, and to Paul Drury for making an eight-year quest finally come to fruition.

NOOTING MISSILES: ADOPT, ADOPT

Missile Command was a massive success for Atari, so it should come as no surprise to learn that a sequel was soon in development after the original continued to pull in the crowds years after its original release. Having cut his teeth on the original game, it was finally Rich's turn to shine as the game's creator. Unfortunately for him, the original sequel hit a number of key issues, meaning it never reached the arcades. This in itself is something of a pity, as his description of *Missile Command 2* fills us with excitement at what might have been had Atari managed to actually release it.

"It was simultaneously two player," he begins about the now long-dead sequel, "We turned the monitor on its side and tried to get a two-player version of the game up and running, where you attacked each other. It was a really challenging concept, but it just wasn't as fun to multitask – at least I couldn't get it to be fun – and try and go over and launch accurate missiles at opponents, while playing defensively against launches from another player.

"I think [that] the main issue with *Missile Command 2* was that the computer launches could be way more efficient and rapid about laying down missile launches, as opposed to humans who had to manipulate the trackball. In that sense it was difficult, and people were so satisfied with the way that the mechanic of *Missile Command* worked that it just didn't do much. I never solved the design for using two players simultaneously, and I just could not make it fun. The screen real estate was another issue, as you actually had a smaller, narrower area to defend. That was my game and we eventually killed it because it just didn't earn. When you started a project you knew that there was a 50 per cent chance that it was never going to get to production. It was a really competitive environment, though, and I wanted to make something really cool. I wanted to have the next big hit game for us." Sadly, with *Missile Command 2*, it just wasn't to be. What a shame...

Dave was keen that *Missile Command* didn't glorify nuclear war, using the end screen to explain that, in such a circumstance, everyone loses.

THE MAKING OF BATTLEZONE

PROBABLY THE FIRST WORKING EXAMPLE OF UPDATING A 2D ARCADE CLASSIC TO 3D, TANK-COMBAT SIMULATOR BATTLEZONE WOWED THE EIGHTIES ARCADE-GOING PUBLIC WITH A MIX OF INCESSANT ACTION AND VECTOR-GRAPHICS GOODNESS. CRAIG GRANNELL TALKS TO LEAD PROGRAMMER ED ROTBERG ABOUT THIS ICONIC TITLE, AND HOW PLAYERS VERY NEARLY HAD A MUCH HARDER GAME TO CONTENT WITH

Although every inch the retro game with its vector graphics and simple gameplay, tank-combat simulator *Battlezone* was a prescient creation. Foreshadowing a common occurrence of the PlayStation era and beyond, the Eighties Atari effort was the first time a much-loved 2D classic was reborn in glorious 3D. Suitably, it was also largely driven by technology. "Well, it all really started with the advent of the vector generator," begins Ed Rotberg, the game's lead programmer and the brains behind other Atari classics, including *S.T.U.N. Runner* and *Steel Talons*. "Howard Delman developed it in response to Exidy's equivalent generator, and we realised that once we had it working, it wasn't a big step to doing 3D."

Tank busters

One brainstorming session later, and the idea of *Battlezone* emerged – a game pitting the player against hostile enemy tanks in what was at the time a truly unique immersive 3D environment. "The inspiration came from those early overhead-view tank games, which everyone loved," explains Ed. "And our game was the first to market with true 3D – Tim Skelly's *Tail Gunner* from 1979 was on-rails and there was no environment, just stars... and there's not much to doing stars in 3D!"

With the team limited by somewhat embryonic technology, Ed's approach to the game was overtly technical, and he was determined to squeeze every drop of power from what was available via a combination of careful planning and tight programming. "Where I started with *Battlezone*, like all my programmes, was deciding how to store the data," remembers Ed. "I knew we needed stationary objects that would have to be described, and since resources were precious, the objects had to be instanced. Hence, I repeated the same shapes throughout the game, merely varying the sizes and positioning."

According to Ed, the maths for doing 3D is pretty straightforward, and this was even the case in 1980, so his next task was projecting a view of the world from '0, 0, 0' in the universe on to the screen. "Once I got that and the field of view right, messing with the various parameters and your perspective divide, I started incrementally moving the camera around and

putting in controls to enable a player to steer the tank," says Ed, identifying this as the moment he got excited about the game. "It was all theoretical until that point, but once I could drive around the playfield, I knew the math and data structures were working, and I realised it was different – no one had ever done anything like this." Ed says he had no illusions at that point regarding *Battlezone* being in any way enduring, but he knew he had the first of its kind, which "was very cool".

Next, it was just a case of putting a suitable moving object out there, which in this case was the very first tank. "Once I knew I could draw an object, it was a matter of encoding the tank in the data format we were using, storing it, and changing its position and orientation every frame, along with its matrix for rotation," says Ed about the progression. "This is where engineer Jed Margolin was very helpful, in coming up with a way of minimising accumulated error. We were using fixed-point machines back then – you didn't have floating-point – and accumulated error could get out of hand, making everything distort."

Battlezone utilised a unique two-stick control system, with each stick controlling one of the tank's treads.

By now, Ed notes that others in the department were also getting excited, and were regularly coming in and playing the game. "That's one way you knew you had a game that was gonna be successful," he says. "You walked into your lab and had to kick people off your prototype so you could work on it!" From there, Ed says *Battlezone* was a case of putting all of the pieces together – adding collision detection, building a score system, working on rudimentary AI for the game's enemies, and crafting the various objects and visual components that went into the final version. In terms of the nature of those objects, Ed notes he was limited by the number of vectors the generator could draw and the number of 3D calculations that could be done in each frame. "The idea was to make something that you could recognise and navigate by," he says. "The mountains were easier, since they were just a backdrop, but everything else was a balancing act of what we could get to show without slowing up the frame rate."

The volcano factor

One exception to the sparsity of the environment is the erupting volcano, which came about due to fellow programmer Owen Rubin constantly hassling Ed during *Battlezone*'s gestation. "We worked in the same lab, and every day he'd come in and ask when I was going to make the volcano active," recalls Ed. One day, with Ed working on a particularly nasty problem, Owen asked the question one time too many, and Ed responded that if Owen wanted an active volcano, he should programme it himself. "The next morning, the code was sitting there on my chair, and it took me a half hour to integrate it, and Owen was very happy," says Ed, laughing. "And I never had to touch that code once I put it in – it just worked."

"YOU WALKED INTO YOUR LAB AND HAD TO KICK PEOPLE OFF YOUR PROTOTYPE SO YOU COULD WORK ON IT!"

ED ROTBERG

Looking at the game now, the volcano was perhaps the team's sole indulgence – elsewhere, *Battlezone* is tightly honed, to ensure the best gameplay experience for the player. The radar, for example, far from an extravagance, is a necessity in such a 3D environment – as Ed notes: "Put someone in our 3D world and they can't turn their head – only ponderously turn the tank – and so they needed to be able to locate enemies, to immediately react and do something about them." Regarding the enemies, Ed designed a fairly linear progression, starting with a standard tank that he terms

"the learning level, where you figure out how to shoot". With that being fairly easy, a saucer was then introduced. "This is a high-point target, but go after it and you'll be distracted from the tank, which makes the game harder," explains Ed. For some variety and added toughness, an unsympathetic super tank was added to the

mix, along with a missile.

Of the enemies found in *Battlezone*, it's easily the iconic missile Ed remembers most fondly. "The missile was interesting because it was the only thing that moved in the vertical dimension, other than the pieces that flew around after something exploded," he says. "I really liked the way it turned out – while there's this pseudo-random motion of zigzagging that a missile takes towards you, after a while you sort of anticipate when it's going to turn and where you need to fire – there's a Zen-like quality to fighting the missiles that was really very different to anything I'd seen in videogames to that point."

CONVERSION CAPERS

Although technology evolved at speed in the Eighties, *Battlezone* was beyond home systems for many years. "I was working with custom hardware and controllers, and the guys converting *Battlezone* had generic systems that weren't powerful enough," says Ed. "They couldn't possibly do all the 3D graphics calculations, and they didn't have the resolution to do the kind of drawing we did on the vector generator."

Despite the evident challenge, some memorable conversions were made, with variable levels of authenticity. On the VIC-20, speed and resolution were sacrificed, but the display somewhat resembled the original. On the VCS, vectors were ditched entirely, in favour of a fast, raster-based effort. "It was like paraphrasing – there's no way these games could quote

Battlezone, but they could paraphrase it, and so that's what they did," considers Ed. "I had no problem with that, because I was aware of the technical hurdles."

Of course, with classic Atari releases, the game was only a small part of the puzzle – the company had a penchant for crafting unique cabinets with suitably distinct controls. In the case of *Battlezone*, two sticks were provided, driving each of the virtual tank's tracks. The reason for this choice, according to Ed, was simple. "We said, well, a tank's got two treads and that's how they turn." Budgetary restrictions limited the treads to a single speed, but this made the controls easy to learn, and various stick positions provided a diverse array of movement, enabling your tank to turn in place, and move in whatever directions were needed.

Early versions of the cabinet also included a viewfinder for the player to peer through. "The idea

Games like the excellent *Combat* and its arcade-based forebears directly influenced *Battlezone*, which took the concept into 3D.

was to make the game more immersive," says Ed. "I don't think it really worked, though, because it was uncomfortable." Ed also notes that this component caused other problems, notably people being unable to see the game when walking by it or when it was being played. "Atari added panels to the side so people could watch, but when it came time to take home a prototype, I took a cab without a viewfinder, because

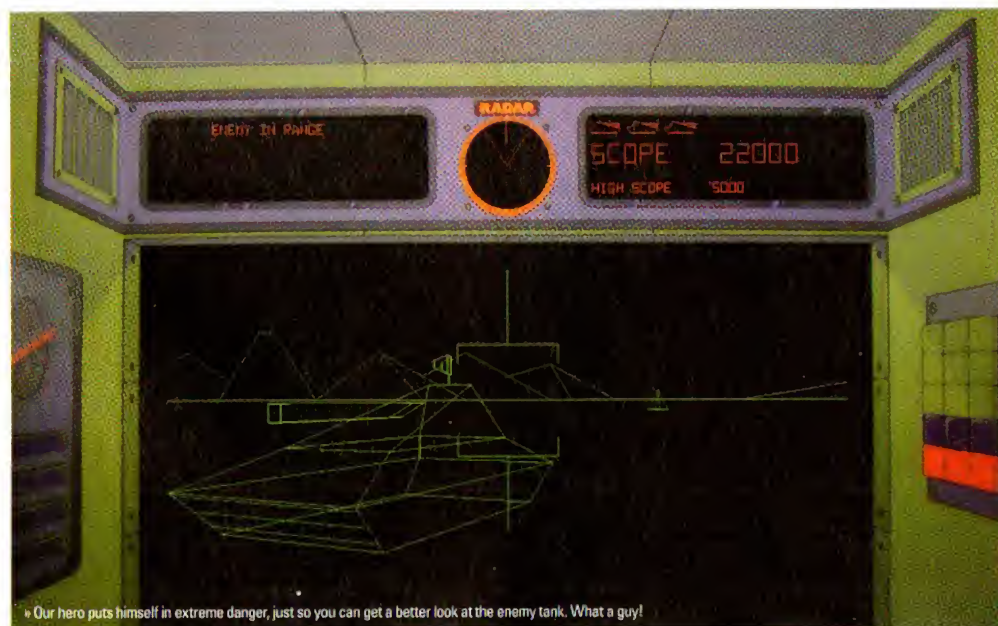

I hated it – and that's what I have to this day," remarks Ed, noting that a combination of cost reductions and earnings indications regarding potential punters being able to see attract screens led to later units dispensing with the viewfinder entirely.

The final shot

With about 15,000 units produced, *Battlezone* was a hit, and various conversions, remakes and *Battlezone* inspired efforts peppered the market for years, ensuring the original game's legacy. We ask Ed whether in hindsight he's happy with the game he largely created, and if other ideas would have made the cut had he not been up against typically tight deadlines. "There are always things you want to include but can't, or things you'd like to improve," he considers, remembering a particularly irksome high-score bug that the team never managed to shake. "From the gameplay side, there

"ONE WAY YOU KNEW YOU HAD A GAME THAT WAS GONNA BE SUCCESSFUL WAS WHEN YOU WALKED INTO YOUR LAB AND HAD TO KICK PEOPLE OFF YOUR PROTOTYPE SO YOU COULD WORK ON IT"

ED ROTBERG ON *BATTLEZONE*'S POPULARITY, EVEN DURING DEVELOPMENT

Our hero puts himself in extreme danger, just so you can get a better look at the enemy tank. What a guy!

WAR ZONE

A surprising offshoot of *Battlezone* was Bradley Trainer, a version designed for the US Army. "A group of retired generals saw *Battlezone* and thought we could come up with a training device for one of their vehicles. They got in touch with Rick Moncrief, who was gung-ho about the idea and promised a prototype in a very short amount of time," grumbles Ed, who, as a member of the 'peace generation', was anti-war and against creating something that indirectly could be used to train people to kill.

"Unfortunately, no one else had familiarity with the platform or code, and so I lost three months of my life working 16-hour days to put the thing together, under condition that if Atari decided to pursue this avenue, I'd be exempt from further work on it," recalls Ed. Ultimately, Atari decided it wasn't a great business to get into, although some good unintentionally came of it. Ed explains: "The controller created for Bradley Trainer ended up being used in numerous other games, starting with *Star Wars*, so in that regard I guess it was a good thing!"

Want a quick *Battlezone* tip: letting tanks get this close, in order to take a neat screen grab, leads to almost immediate death.

were people who'd get really into playing for a long time, and we came up with ideas for increasing the urgency and decreasing the game time."

Had these ideas been implemented, *Battlezone* may have had an additional and particularly savage foe. "We talked about having launch tubes on the playfield, which you'd get a warning about and have to reach before they launched a missile," says Ed. "But unlike the standard missiles, these would come and kill you from above, where you had no defence at all. So you'd be dealing with those, super tanks and the other missiles at the same time." Mercifully, the original intent was for these devious missiles to only make an appearance far later in the actual game.

While on the subject of extra components, we ask whether there was ever any truth in the various *Battlezone* rumours, such as the rumoured concepts for reaching the volcano or discovering a tank factory spewing out enemy tanks. "No, the background was strictly a background – it rotated and was at infinity, quite literally," says Ed, adding that there were never any plans for it to be otherwise. "We got all kinds of letters from people asking about this, or claiming their friends got to the volcano once. But the playfield wrapped around – 16-bits in either direction and you were back at zero!"

As the interview draws to a close it's becomes very clear to us that Ed has a lot of affection for his near-30-year-old creation. He still talks about *Battlezone* with pride and enthusiasm, like it's an exciting new creation, and we ask whether the game was a particularly good title to work on. "It was a great game to work on," Ed confirms. "I got to use stuff I learned in college that had lain dormant until then. I also felt *Battlezone* was groundbreaking, and it's always a really cool feeling when you know you're doing something no one has seen before."

Special thanks to Frederic Delaire (www.arcadefever.net)

» The VCS *Battlezone* conversion dispenses with vectors and replaces them with a colourful landscape. The compelling gameplay of its arcade parent remains largely intact, though.

"PEOPLE CLAIMED THEIR FRIENDS GOT TO THE VOLCANO, BUT THE PLAYFIELD WRAPPED AROUND – 16-BITS IN EITHER DIRECTION AND YOU WERE BACK TO ZERO"

ED ROTBERG ON PEOPLE BEING ABLE TO ACHIEVE THE IMPOSSIBLE

Stellar 7, which was released on a number of different formats, takes the basic premise of *Battlezone* and surrounds it in a mission-based wrapper.

THE MAKING OF TEMPEST

ATARI'S FIRST COLOUR VECTOR GAME WAS AN ADVENTUROUS, ABSTRACT SHOOTER THAT TOOK ARCADES BY STORM AT THE BEGINNING OF THE EIGHTIES. TEMPEST CREATOR DAVE THEURER TAKES PAUL DRURY FOR A SPIN

» Shooting and moving is the key to success in *Tempest*.

» As the level finishes you'll fly down to the next stage.

» Avoid getting grabbed and pulled into the abyss.

Would a game by any other name play as sweet? "The prototype *Tempest* machine was called *Vortex*," explains Dave Theurer, the man behind the seminal shooter, "but some players joked about how it sounded like a feminine hygiene product – Tampax! We decided it had to be changed..."

Thus Atari's colour vector debut was given a title that suggested a swirling maelstrom rather than period pains or, indeed, a toilet cleaner. Atari's *Tempest*, an utterly compelling blaster that threw players headlong into the action, was Dave's third game for the company. His coding career at Atari had first begun in 1979 with the four-player version of *Atari Soccer*, and the following year he created his second trackball-based title, the mighty and massively popular *Missile Command*.

Where that game had tapped into the Cold War era's palpable fear of nuclear devastation, his next project also intended to play on something significant in the popular consciousness of the day: Taito's *Space Invaders*. "I loved that game," beams Dave. "When it first came out, we got a unit in our labs and I played it a lot. As soon as I'd wrapped things up on *Missile Command*, I wanted to take a shot at 'first-person' *Space Invaders*." Management gave Dave the go-ahead for this re-imagining of the arcade industry's first global hit. Initially working with black-and-white vectors, before moving the project over to the new colour vector hardware, he produced a playable version, with rows of angry aliens plodding towards your ship. Successfully creating a convincing sense of 3D was of course encouraging, but

Dave soon realised that he had a far bigger problem that he had to solve.

"It just wasn't much fun," he concedes. "Gene Lipkin, the head guy at Atari at the time, came into our lab for the first review, played it, and just said, 'ho-hum'. It was interesting to look at but I think the structure was a bit too loose. Having enemies come at you in 3D without enough reference points to accurately gauge

where they were in the 3D space made it difficult to aim and to position your ship."

It was time for a major rethink, but rather than look to the arcades for inspiration, Dave turned to his subconscious. He recalled a strange, recurring dream from his childhood, involving monsters creeping up from a deep, dark pit in the ground. His supervisor, Steve Calfee, liked the idea and asked Dave to produce something. With renewed

"BLASTING DOWN THE PLAYING FIELD AT THE END OF A WAVE AND THEN THE COOL FEELING OF LIFTING OFF THE BOTTOM OF THE PLATFORM INTO SPACE IS EXHILARATING"

DAVE THEURER

vigour, he set to work turning the vague concept in his mind into a prototype game design that could take advantage of Atari's new technology. "I was totally excited," he enthuses. "It was colour. It was 3D. It was fast. It was new! The colour vector hardware could do things on screen never done before."

Working in this brave new world was invigorating but not without its challenges. The technology was still being developed alongside Dave's monster shooter, and while the hardware never actually ignited, problems with the deflection amps could lead to frustrating monitor malfunctions... or worse. "Working with the prototype colour vector display was risky: if you parked the beam off the screen for too long, it would burn a hole in the phosphor coating on the screen!"

CONVERSION CAPERS

ATARI 2600

Attempting to re-create 3D vector graphics on the VCS was naive, so no surprise that this fails miserably. The tubes become a mess, aliens bulge awkwardly out of the confusion, and bullets flicker in and out of visibility.

TEMPEST TUBES

Not a home version as such, though it did eventually appear on the *Atari Arcade Hits: Volume 1* PC compilation in 1999, but rather an interesting hack by Duncan Brown.

ATARI 5200

A boxed version of the game can be spotted in the film *Cloak & Dagger*, but this remained unreleased until a prototype version finally surfaced in 1998. The game looked very promising, visually and play-wise.

TEMPEST 2000

Jeff Minter had been a huge fan of *Tempest* since discovering it in a Piccadilly Circus arcade in the early Eighties. He jumped at the chance of revisiting the game for the Jaguar a decade later.

If at first you don't succeed...

Undeterred, Dave set about designing his cutting-edge project in a charmingly old-school fashion. "Everything – enemy objects, the player object, surfaces and so on – was drawn on square grid graph paper first, because there was no appropriate design tool at the time for this type of graphics," he explains about the early months of his iconic game. "There were lots of surface designs, enemies and player objects that were tried and rejected." Those that made it through were indeed an odd, unearthly bunch. Multicoloured Fusatops, dancing skittishly inside the abyss, deadly Pulsars crackling with electricity, and the hordes of Flippers, which skipped like spiders across the web-like levels, created a surreal swarm of adversaries. In fact, the way your blaster crawled along the outer edge of each of the 16 differently shaped holes from which these horrors emerged had a certain insect-like quality, which suited the game's abstract appearance.

"That was incidental," says Dave. "The goal with the player object was to create something that would change as you moved to show you exactly how you were moving, when you'd transition to the next position, and where, exactly, you were in relation to the grid. It needed a body and legs, and it all came together after many, many attempts."

The game was indeed coming together. By ensuring the enemies were 'stuck' to the surface of each hole and the player ship was restricted to movement along a defined surface, it was far easier for players to sense where they and their foes were in the three-dimensional space, thus overcoming the awkwardness of the initial 'first-person *Space Invaders*' concept. The player experience was further enhanced by another key decision: to use a 'spinner' controller rather than a traditional joystick.

"The controller has a fabulous feel when you spin it," agrees Dave about the iconic device. "Just the right amount of resistance and just the right amount of angular momentum when you stop applying the force. I know we didn't have it with the *Space Invaders* game because that was motion left and right on a semi-flat surface. We must have switched to this controller when we changed to the *Tempest* gameplay, with the

ROMAN NUMERALS

Eagle-eyed arcade gamers with a knowledge of Roman numerals may notice that the copyright message on the title screen of *Tempest* says 1980, yet the game wasn't officially released until 1981. We asked Dave about this discrepancy but he couldn't enlighten us, so we turned to RG's resident Atari expert, Marty Goldberg. "You can't go by start screens, as most of the copyrights in those were put in during development as a protection before the copyright was actually filed for," he explains. "The copyright for *Tempest* was filed for on 30/9/81 and lists 5/81 as the 'publication' date, which means the date the materials were first exposed outside of Atari, most likely when initial field-testing started. The actual release date is October of '81, which is when they started promoting *Tempest*. Some of the early ROM revisions have the copyright dates the year before." So now you know. Thanks, Marty!

» The 'graduated V' layout of level 9 was always our favourite. "It's one of mine, too," adds Dave, reassuringly.

action around the top edge of the 3D cylinder tapering off into the distance. I often hear people rave about the controller when they tell me how much they loved the game. It was extremely important."

It was the perfect control setup for a game that required you to swiftly skip around the rim of cylindrical levels to deal with multiple dangers radiating from its centre. Those strange geometric shapes gave *Tempest* a unique visual appeal, an abstract beauty that lent the game a timeless feel. Did Dave have a definite artistic vision for his project?

"We had the limits of our vector hardware to keep in mind," he notes. "It kept things sweet and simple. It's also nice to have it abstract when it involves blowing things up; I don't like explicit graphic violence. I do love fireworks, though, and the colour vector display gave me a chance to do a cool fireworks show when you get a high score. Also, the Super Zapper gave us a chance for another cool graphics display."

Zapper power

Ah, the wonderful Super Zapper, which gave the player a last-gasp chance to destroy his foes as they overwhelmed his position and began creeping ominously towards his ship along the outer edge. Used once, it could be devastating; used again during the same wave and its effect was muted, leaving you to fight unaided until the next level, when it was thankfully recharged. Ending each stage also brought a memorable surprise, as your ship plunged into the hole, requiring some swift manoeuvring to avoid being impaled on deadly green spikes that had grown like accelerated stalagmites during the fray.

A further surprise awaited the player before they even began blasting. An options screen offered them the

chance to select their start level, and choosing a higher stage to begin on would reward them with a greater bonus. It was a clever feature, dubbed 'skill-step', which allowed expert players to skip straight to the challenging stuff and boost their high scores, while not alienating newbies. "Yes, that was my idea," smiles Dave. "We wanted to maximise the fun time/total play time ratio. It was also to satisfy me and the other players in the lab.

We didn't have all day to play the game..."

And play it they did. The ethos at Atari's coin-op division at the time seems to be one of friendly rivalry, with engineers encouraged to play their colleagues' games as they were in development and make useful suggestions, while still hoping their own project would be the one to triumph in the arcades. "Everybody would love to have a hit

game," laughs Dave, "but it was a friendly environment at Atari. People felt free and open about saying anything, positive or negative, about a game. It was up to the developer to be able to handle the feedback without getting his ego involved."

Fortunately, Dave was beginning to hear very good things about his brand new arcade game. The project took almost a year from initial idea to final release, and once the 3D *Space Invaders* concept was ditched, Dave remembers development being generally smooth and free of glitches. However, as we probe deeper, we discover that an early iteration of *Tempest* wasn't quite as well received as the one we all know and love today. In fact, it made people sick.

"The first version had the surface moving and the player's object stationary," he recalls. "Personally, I got nauseated after working on it for a period of time. Some others had a similar reaction. This version didn't last long and was eliminated a long time before field-

TEMPEST MEMORIES

My favourite memory of *Tempest* was how it started. Dave was supposed to be working on 'first-person *Space Invaders*' and we used to kid him about how his first attempts looked like things attacking you on a bowling alley. One day, we came in and the whole game had changed into *Tempest*! It was, like most of Dave's work, mind-numbingly good. He understood what made a game fun, and most importantly, he was willing to completely rewrite his game, if that is what it took to find that fun. With *Tempest*, you always felt like you could do better and you simply couldn't wait to drop another quarter in to prove that! It was, for its time, visually stunning, followed the classic 'easy to learn, hard to master' paradigm, and had that special Theurer magic. Dave was, and still is, just a terrific guy. Salt of the earth and all that. I still count him as a very good friend. When he used to have a full beard, my first wife would always tell me how he looked like a Norse god!

» Ed Rothberg: Battlezone

TEMPEST MEMORIES

We were doing 'walkabouts' at Atari at the time when *Tempest* was being developed. Walkabouts were used to get everyone at Atari to play your game and leave comments, one Friday a month, I believe. I'm sure Dave would have listened to any constructive criticism of gameplay from anyone. He was known for rewriting games if he felt they were not what he wanted. This was very unusual at Atari. I'm not sure if the final *Tempest* was his second try or his third. I remember one of Dave's first games was a soccer game with a trackball, a take-off of *Atari Football*. The problem was, you were so tired after one game you couldn't play another even if you wanted to! *Tempest* sold 30,000 units, so it was a very popular game. I'm not sure if it was the first game that allowed you to start at higher levels, but if it was, this certainly would have made *Tempest* a landmark for developers and players.

The games

TEMPEST MENTIONS

When I first saw *Tempest*, possibly at Mother's arcade in Chicago, possibly at another arcade or two, I found it so cool. I was totally blown away. The colour vectors were terrific, of course, but what really knocked me off my feet was the sense of depth that sucked me in, almost literally! Interestingly, if my memory serves, I only had a slight connection with true colour vectors. My Cinematronics games were given colour overlays, as in *Armor Attack* and *Star Castle*. It was only when I moved to Gremlin/Sega that I was able to experiment with colour vectors as a programmer and designer.

However, this was only for a short time, as I wanted to get away from vector graphics for a while. But enough about me! All hail *Tempest*! One of the most innovative and beautiful videogames ever made!

» Tim Skelly: *Star Castle*, *Warrior*

testing. No one got sick on the machine, but it did put a damper on one's desire to keep playing it!"

We briefly ponder the thought of vomit buckets being attached to arcade cabinets before inquiring about those crucial field tests. Their importance cannot be overestimated. An overflowing cash box after a week out in a real arcade could lead to a huge production run for your game. An empty one could result in a project a programmer has laboured over for months or years languishing as a prototype forever. Just how anxious was Dave before *Tempest* was sent out into the field, given that the game was such a radically different proposition for players, both visually and gameplay-wise?

"No, we weren't nervous about it. It was new, exciting technology coupled with new, fun gameplay. We all loved playing it and were eager to get it out there and see how it would do. We would deliver it ourselves to the arcade in a truck and then stand back and watch the action. Often players would line up and put their quarters on the bezel to reserve their spot. We'd try to blend into the background, but stand close enough so we could get feedback from players' initial reactions.

Observing difficulties of new players, and resolving them, was key to making your game more popular." Which brings us back to the small issue of what to christen their baby. After noting the unfortunate association between the *Vortex* name and a feminine hygiene product, a new moniker had to be chosen. "Getting the right name for the game took a lot of effort and time. We started out calling it *Aliens*. The movie

Alien had come out, so there was some identification, but some of us thought it was too close to the film name. So we came up with the name *Vortex*, since the first level was a cylinder, and you go swirling down it like a vortex at the end of the wave. The prototype *Tempest* game I have in my garage has a bezel with the name *Vortex* on it, but when we decided it had to be changed, Morgan [Hoff, the project leader] and I came up with a big list of potential names. Lots of folks at Atari associated with the game voted on their favourite

name and *Tempest* was the winner. I had lobbied for that name so I was happy!" Democracy triumphed and so did the newly titled *Tempest*, selling an impressive 30,000 units and introducing the sparkling QuadraScan Video Display Unit to arcades. It was the perfect calling card for Atari's colour vector hardware; a game that showcased both pioneering visuals and innovative play mechanics, paving the way for the massively popular *Star Wars*, along with brilliantly experimental titles like Owen Rubin's *Major Havoc* and *Black Widow*.

"THE FIRST VERSION OF TEMPEST HAD THE SURFACE MOVING AND THE PLAYER'S SHIP STATIONARY. IT MADE PEOPLE FEEL NAUSEOUS. WE NEVER GET SICK OF IT THOUGH"

DAVE THEURER

Wars, along with brilliantly experimental titles like Owen Rubin's *Major Havoc* and *Black Widow*.

One more thing...

Perhaps perfection isn't quite the right term, though. Just before the final version of *Tempest* was about to go into production, Dave noticed something that bothered him. An Atari logo on the start screen didn't look quite right. He decided to fix this tiny detail, but his solution had some unforeseen consequences.

"It was lopsided enough to make some players think, subconsciously perhaps, that something just didn't look

TEMPEST MENTIONS

I was supposed to get the first colour vector game for *Space Duel*, but when *Asteroids Deluxe* came out, they decided that *Space Duel* was too soon behind and pushed it back in the schedule. So the colour vector system went to *Tempest*, as did some of the vector work I created plus some sound routines, so that was cool. It wasn't a big deal, as I got an improved one for *Space Duel* as they worked out the kinks. I got an even better one for *Major Havoc* with some of my own changes, like sparkling vectors. The colour vector hardware was fragile. It didn't catch fire or anything, but it would constantly blow out the deflection amps and the monitor would stop working. It was also slower than the monochrome version at first, so you couldn't draw as much. I knew Dave very well, and played *Tempest* all the time during development... and found a few bugs, too! I thought the original *Space Invaders* concept sucked big time but, as it evolved, it was obvious *Tempest* was going to be great.

» Owen Rubin: *Major Havoc*, *Space Duel*

» The mighty *Tempest 2000*. A 'making of' feature is in the RG pipeline, Minter fans.

right," says Dave, "so I adjusted the layout of the screen at the last minute. I forgot that I had booby trapped the game so that if game pirates changed our screen by replacing 'Atari' with their own company name, it would trash a random location in memory after a delay of a few minutes, so they wouldn't be able to easily detect this with a hardware analyser. If the score was in a certain range, I'd take a couple of the digits from the score, and use that to come up with the hardware address in RAM to trash. Of course, the coin counter was in RAM, and that got trashed if the digits in the score pointed to that address. It took us two months to figure out the cause!"

Thus some fortunate players would unexpectedly receive 40 free credits, which was rather handy given the difficulty of the game at higher levels. Fuseball and Pulsar Tankers, which split into two evil enemies when shot, would appear from levels 33 and 40 respectively, and those master blasters who could reach stage 65 would be presented with the disorienting prospect of invisible tunnels. The brutal challenge that *Tempest* presents is perhaps one of the reasons why it remains such an iconic title.

No sequel please

"I still enjoy playing *Tempest* if it's on a platform with a spinner controller," says Dave, proudly. "It feels good and it looks pretty; lots of colours, cool shapes, explosions and visual surprises, like blasting down the playing field at the end of a wave and then the cool feeling of lifting off the bottom of the platform into space. It's sort of exhilarating..."

Despite his obvious affection for his hit arcade game, Dave never really contemplated making a sequel to *Tempest*. This in itself is rather strange, because even then sequels were slowly starting to become more popular with gamers. Dave instead preferred to work on new technology and, indeed, his next project was the equally groundbreaking *I, Robot*, a marvellously ambitious game that pioneered the use of polygon graphics. So, with his time in the tunnels over, we wonder whether that childhood dream of sinister creatures emerging from the earth ever reoccurred.

"Never again," Dave assures us when we ask him. "Those nightmares were from a very short period when I was very young."

And we were left with a dream of a game...

TEAM TEMPEST

Though *Tempest* was primarily Dave's baby, he is quick to give credit to his collaborators. "Morgan Hoff was the project leader. He was very calm, thorough and analytical about handling the development process and keeping all the various phases of the project in sync. Mary Pepper was the technician. Doug Snyder was the hardware engineer. He was funny; occasionally when the PC board wouldn't work, he'd pick it up about six inches off the workbench and drop it. This would often reseat the chips and it would start working again. Another time, we couldn't get the dev system to work; it turned out that the board had gotten so hot that the solder, which held in some of the chips, had melted and they had literally fallen out of the board onto the bench below!"

"IT FEELS GOOD AND IT LOOKS PRETTY; LOTS OF COLOURS, COOL SHAPES, EXPLOSIONS AND VISUAL SURPRISES, IT'S SORT OF EXHILARATING..."

DAVE THEURER

» The original arcade flyer was a lavish gatefold affair.

While most levels are cylindrical, others have a horizontal layout, a nod to the original 'first-person *Space Invaders*' concept.

» *Tempest* requires insane reactions. Can you handle it?

» Watch out for the spikes as you hurtle towards the next stage.

THE MAKING OF PITFALL

WHEN MARIO WAS CONTENT DODGING BARRELS THROWN BY A GIANT MONKEY AND BOOTING KOOPAS ABOUT, A TRUE PLATFORMING HERO WAS ALREADY MAKING HIS MARK, COLLECTING TREASURES AND AVOIDING NASTIES – AND ALL ON THE HUMBLE ATARI 2600. JOIN CRAIG GRANNELL AS HE TALKS TO DAVID CRANE ABOUT THE GENESIS OF PITFALL!

Pitfall! For gamers of a certain age, the name alone is enough to bring about a warm, fuzzy feeling of gleeful nostalgia.

Often cited as the earliest example of traditional platform gaming, released as it was in 1982, programmer and Activision co-founder David Crane managed to eke out more than many thought possible from the humble Atari 2600.

Technically amazing for the time, the game featured varied backgrounds and other impressive tricks. Pitfall's slick visuals were matched by its all-engrossing gameplay, the player guiding Pitfall Harry through dozens of 'scenes', searching out treasure, using vines to swing across gaping pits, leaping on to the heads of crocodiles, and nipping underground to take shortcuts.

The genesis of *Pitfall!* was its main character – in the late Seventies, David was tiring of typical games.

"Back then, there were very few attempts at animated figures in games – you controlled tanks, jet planes, *Pong* paddles, and so on, because the limited number of display pixels severely restricted the creation of smooth animation," he explains. But in 1979, David had developed a realistic-looking human character – he just needed a game for him. "Each time I was about to start another game, I brought out my little running man and cast about for a game that needed him," remembers David. "I tried a cops-and-robbers game, in which the man was running from the police, but I didn't like that concept, and so he went back on the shelf."

Eventually, in 1982, David was between games and decided he'd finally figure out a game for his diminutive animated man. He sat down with a blank sheet of paper and drew a stick figure in the centre. He then said: "Okay, I have a running man... Let's put him on a

path," and drew two more lines on the paper. The path needed a location, and so David placed it in a jungle, surrounding it with trees. And then he had to figure out why his character was running in the first place. "I drew treasures to collect, enemies to avoid, and Pitfall! was born," he says, noting that the entire process of coming up with the concept took about ten minutes (although the subsequent programming clocked in at a rather more lengthy 1000 hours).

Inspiration time

As David developed his game, three clear influences crept in: "First, *Raiders Of The Lost Ark* was playing in cinemas, and that started me thinking of an adventure in the jungle in the first place. Secondly, I really wanted Harry to swing on a vine, for which I have to give a nod to Tarzan. And finally, I remembered from deep

IN THE KNOW

in my childhood a pair of Magpie cartoon characters called Heckle and Jeckle. They had a sequence during which they'd run across the heads of alligators, barely escaping the snapping jaws. I thought that would make for an interesting skill sequence in the game." But even with these elements starting to fall into place, David considered *Pitfall!* too linear: "The game began as a single-level trip through the jungle, but that made for a boring experience." The solution was the addition of an underground passageway, guarded by scorpions. This provided a crucial level of strategy to the game, because each screen that Harry traversed underground was the equivalent to three screens on the surface. "Using the underground paths, you could bypass empty or treacherous overhead screens, and without using them, you can't finish the game," says David. Although simple by today's standards, cramming all of

these ideas and characters into the Atari 2600 was a huge undertaking, and David admits that many ideas had to be tailored specifically for the console. "All objects in an Atari 2600 game are selected based on what can be drawn using the system's limited capability," he explains. "For example, early in my career at Atari, I designed a slot-machine simulator. When I tried to draw traditional slot-machine symbols – cherries, lemons, oranges, and so on – it became clear that there was no way to render them in eight monochrome pixels. Therefore, I used cacti, cars and other angular objects that were easily recognisable when drawn with pixels." A similar process was used with *Pitfall!*, with David colouring in squares on squared paper to figure out what the pixelated graphics would look like: "I experimented with [different] objects until their identities

were clear, and made the game work with the best-looking graphics."

Pixel power

Oddly enough, *Pitfall!* Harry sort of started life as David himself, before being reduced to a handful of pixels: "I'd worked on the little running man for a while, posing in mid-stride and sketching my own leg and arm positions, and so you could say that what you see is me running across the screen. Once you reduce something to a

few pixels, however, any similarity to any person, living or dead, is lost!" Elsewhere, the swinging vine also proved to be a technical challenge.

"It was made out of a single-pixel-wide Atari 2600 object whose position was moved left or right down the screen – you can see the same technique in two of my earlier games: *Fishing Derby* and *Laser Blast*," says David. Even carefully crafting pixel-

perfect graphics wasn't enough to get around the 2600's limitations, though, especially when taking into account the sheer size of *Pitfall!* "The world of *Pitfall!* is a circular path 254 screens in circumference. The game ROM contains only 4K of memory, and so there's not enough memory to hold both Harry's graphic frames and the definitions for 254 screens," explains David, noting that the largest ROM in 1982 was a mere 4096 bytes, and that these days, 254 screens could take over half a million bytes. "But this is the kind of challenge that I have always enjoyed," says David. "I solved the problem on *Pitfall!* by creating an algorithm that defined every screen mathematically. The actual definition of the entire world took fewer than 50 bytes of ROM."

The way David went about accomplishing this was, he says, very technical. "At the core is a polynomial

"RAIDERS OF THE LOST ARK WAS PLAYING IN CINEMAS, AND THAT STARTED ME THINKING OF AN ADVENTURE IN THE JUNGLE IN THE FIRST PLACE"

DAVID CRANE

Harry thanked his lucky stars that the crocodiles were too lazy to eat anything that didn't stumble right into their open mouths.

TEAM PLAYERS

Although many of Activision's games are credited as solo projects, David notes that much of the company's success

came from the group synergy within the design lab: "While we each had our own game project working, we'd also kibbutz on each-other's games. That way, each game had the flavour of its designer, but benefited from the vision and experience of the entire group."

Pitfall! was no exception. David explains that only a week before *Pitfall!*'s release, the game only offered the player a single life. "I was experimenting with that concept as sort of the ultimate challenge," David explains. "That's right – fall in one pit and start over from the beginning! Thankfully, my buddies practically tied me to my chair until I put in extra lives, and I'm glad they did!" David notes, though, that most help came in much smaller details: "These things were so small that taken individually you'd never notice. It was the sum total of all the feedback and suggestions that polished the games to a fine edge."

counter – a special binary counter that counts in a pseudo-random sequence. We used these polynomials to generate randomness in many of our games, but for the screen definitions I made a special counter that could create a sequence both forward and backwards," explains David. "If I called one algorithm, it would give me the next number in the sequence; with another, I could get the previous number." Therefore, if *Pitfall!*

Harry ran off of the right-hand edge of the screen, David called up the next number in the sequence; if he turned around and ran back off of the left-hand edge, he'd call up the previous number. With this number used to define each screen, a unique scene was defined that's the same each time the player visits it. "That was the tricky part.

Now, if we select screen elements based on this

number, we can define each individual screen. For example, we can define the background tree patterns based upon three bits of the 8-bit number, and the pit or pond type from three other bits. As long as every detail of the screen is based on that one number, the entire world can be computed algorithmically with very little memory. After that, you just have to find an interesting point in the sequence to start the game! As far as I know, this is the only time this technique has been used in this way."

It's all in the details...

With such attention to detail and careful programming along with the fact that *Pitfall!* was a huge technical achievement, it perhaps comes as little surprise that David wouldn't want to turn the clock back and change anything. "I tweaked the heck out of that game, and I didn't let it go to market until I was satisfied. There is nothing I would have done differently," he claims. When

pressed, though, he does admit that the limitations of the Atari 2600 meant that one thing couldn't make it into *Pitfall!*: "I wish I could have provided really cool victory sequences in my Atari 2600 games. A player who completed the game and collected every treasure should have been rewarded with an amazing animation, but there was never enough memory left over once the

"PITFALL SPAWNED AN ENTIRE GENRE OF GAMES; THERE WERE OVER 600 PLATFORM GAMES RELEASED TO THE MARKET FOLLOWING PITFALL!"

DAVID CRANE

game was complete."

Clearly, such niceties didn't matter to the games playing public at the time. *Pitfall!* was a resounding success for Activision, meeting with huge critical acclaim. Many gamers were amazed at what their humble Atari console was suddenly capable of, and the result was *Pitfall!* sitting atop the Billboard charts for a massive 64 consecutive weeks, shifting an estimated four million copies. "You can't have success like that and not know you had a hit on your hands,"

says David, in reaction to us asking whether he always knew *Pitfall!* was something special. "Even early on in development, it was clear that this was a milestone in videogames – the first 'platform' game. It opened complete new worlds of exploration-style games." So, how does it feel to be the one to kick-start a genre, and for others to exploit it so thoroughly over the coming years? "Pitfall! did spawn an entire genre of games: there were more than 600 'platform' games released to the market following Pitfall! – a clear example that imitation is the sincerest form of flattery," mulls David. "But, honestly, that was nothing new in the early days of Activision – there wasn't a single game created in the first five years there that didn't contain an advancement for state-of-the-art videogames. Whether it was a new programming technique, a new graphic feature, or just some new way to make the 2600 perform, every game we released spawned imitations." In fact, David even claims programmers from other companies have since admitted to him that they lifted complete sections of code from Activision games just to be able to compete on the same playing field! "But at the time, there were only a handful of people in the world who knew how difficult it was to make the unique displays in our games," concludes David. "It was like having one's entire working life become one giant puzzle. Fortunately, I like puzzles!"

David may have faced many technical challenges while working on *Pitfall!*, but the hard work and effort was certainly worth it. *Pitfall!* and its sequel remain two of the most striking platformers on the Atari 2600, and remain that way all these years later.

"IT WAS LIKE HAVING ONE'S ENTIRE WORKING LIFE BECOME ONE GIANT PUZZLE"

DAVID CRANE

DRIVING GAME

Although primarily tied to the small screen (along with a momentary leap to the arcades, as we'll see next month), *Pitfall!* has one unique placement in

the real world, in the form of David Crane's car number plate. "In 1982, I had just gotten a new car and I was thinking about getting a personalised licence plate," he recalls. "It dawned on me that 'PITFALL' is a seven-letter word, and seven letters was the limit at the time for personalised plates in California." David said that he ran right out to the DMV (Department of Motor Vehicles) and grabbed the plate. "I still use it today, 25 years later," says David, clearly proud of what's turned out to be a smart investment. "And it still gets a few comments, although the most common response is, 'Funny plate... What do you mean it's a videogame?'"

Harry stared longingly at the huge gold bar, wondering how he would fit it in his pocket.

Harry made a mental note to discover who built the underground tunnel, to avoid using the same interior designer.

With seconds left on the clock, Harry's realised his chance of collecting all the treasure was lower than the underground scorpion breaking into song.

Harry was just starting his adventure, but he was already getting fed up of constantly jumping over logs.

Majestically leaping over the giant scorpion, Harry regretted not bringing a can of extra-strength bug spray to the jungle.

As Harry fell down the pit, he gained crucial first-hand experience regarding the relevance of the game's name.

As Harry admired the giant ring, he decided he didn't want to meet the girl on whose finger it would snugly fit.

THE MAKING OF MINER 2049ER

SITTING BETWEEN PITFALL! AND MANIC MINER IN THE PLATFORM-GAME TIMELINE, MINER 2049ER IS SOMETHING OF A FORGOTTEN CLASSIC. WITH THE RECENT MOBILE REMAKE THRUSTING THE GAME BACK INTO THE SPOTLIGHT, CRAIG GRANNELL TALKS ARCADE GAMES, COLOUR AND SOUND WITH BILL HOGUE, THE ORIGINAL GAME'S CREATOR...

From talking to Bill Hogue, it's very clear that he was once an avid gamer and devourer of new technology. He recalls working at a Radio Shack in Reseda, California, which received one of the first TRS-80 computers. "Between serving customers, I learned how to program in BASIC and machine code," he begins. "One night, the store's alarm system went off, due to a loose wire, and they called me in to wait for the alarm company to repair it."

The police were also called, and they had guns drawn on me while I was playing on the computer, waiting for the alarm company." From Bill's initial dabbling in programming while working at Radio Shack, Big Five Software was born, initially releasing acclaimed games for the TRS-80. When Bill had tired of the restrictions of the Tandy machine, it was the Atari 400/800 that beckoned, predominantly because of its graphics and sound capabilities.

Bill's first creation on Atari's then cutting-edge

hardware became a classic of its era, and, in hindsight, something of a genre-defining game. Although David Crane's *Pitfall!* is typically cited as the first home-console platform game, *Miner 2049er* is one of the earliest examples

akin to subsequent platform games in any meaningful sense (such as *Chuckie Egg* and *Manic Miner*, through to the likes of *Impossible Mission* and beyond). Unlike many of its contemporaries though, *Miner 2049er* doesn't solely task the player with collecting items and avoiding nasties on each of its ten levels – Bounty Bob has to walk over every piece of ground in order to actually complete a level. The conceit – added after much of the gameplay had long been completed – is that Bob is on an important mission to inspect every inch of each of the mines, in search of the malevolent

Yukon Yohan. However, rather than adding this element to increase the game's challenge, Bill reckons it was "more to do with *Pac-Man* than anything else", although he adds, "I was never very good at *Pac-Man*, so I'm not sure why I borrowed any elements from the game."

Mixing things up

Elsewhere, it's clear that gameplay elements from other arcade games seeped into the mix, although, as Bill explains, at the time this was nothing new for him: "All of my early TRS-80 games were very similar to the arcade games that Jeff Konyu [Big Five Software's TRS-80 graphic artist] and I used to pump quarters into at our various hangouts. *Miner 2049er* was the result of wanting to blend together fun elements from many different arcade games we loved to play." Bill notes that there are ideas in the game somewhat based on *Donkey Kong* – "especially the climbing aspect" – and that *Pac-Man*'s influence extended past exploring

every piece of each level: in *Pac-Man*, ghosts become vulnerable after a power pill is consumed. Similarly, *Miner 2049er* enables Bob to dispose of the otherwise deadly radioactive mutants roaming around each level, after grabbing one of the

various items found in the mine (presumably left behind by careless or very dead past miners).

Like many games at the time, *Miner 2049er* was put together quickly. "I believe we had the gameplay sorted first, and then worked later to figure out what it was we had invented", laughs Bill. "We decided that perhaps our hero was stuck in a mine and – for reasons I cannot remember – he was a member of the Mounties in Canada. Actually, I wonder if that had something to do with a bar at the Disneyland Hotel that Jeff and I used to frequent – it had a definite Canadian

PORTABLE PROSPECTOR

Although most identified with early-Eighties home computers and consoles, *Miner 2049er* entered the embryonic

mobile gaming world via two distinctly different products. The most instantly recognisable as a version of Hogue's original game is Mindscape's Game Boy conversion, released in the early-Nineties. Bill notes, sadly, that this version "was a really poor sales performer", perhaps due to the original's impact waning significantly by the Nineties. Over a decade passed before the release of Magmic's mobile version, while any DS or PSP *Miner 2049er* remains an unlikely prospect for fans.

That said, stranger things have happened, and the Tiger Electronics's *Miner 2049er* LCD game is certainly one of those things. Based on the final level of the original game, Tiger's version tasks you with using TNT to fire Bob to high platforms, enabling him to grab 'prizes.' Surprisingly evocative of the original, Bill notes that he "didn't have any connection to it, other than signing my name on the licence agreement", adding, "it was nice for its time, of course, when the toy industry was cranking those things out." Clearly, they didn't crank out too many, because the unit is now very rare, although you can sample its delights via Pete Schlepphorst's Windows-based simulator (<http://webpages.charter.net/ps4/m2049lcd/index.htm>).

The games

MODERN MINER

wilderness feel to it..." Keen to create something unique for home consoles, Bill also took another cue from *Donkey Kong*, adding exclusive features to each level. In contrast to many other platform games of that era, where you pretty much see everything the game has to offer features-wise in the first couple of screens, *Miner 2049er* introduces slides, transporters, lifts, deadly 'pulverisers' and, in Level 10, a chunky cannon, which, via the use of TNT, fires Bob into the air, so he can reach higher platforms. "I did try to space out the 'special equipment', so that each level would be a new and different challenge", explains Bill. "If you just look at the first level, you have no idea that there are slides, transporters, lifts, and even a cannon that you will have to contend with later. Each item was programmed separately, too, so that each screen has its own special look and feel."

Difficult choices to make

Of course, many of these elements make an already tough game even tougher, but Bill is unrepentant about *Miner 2049er*'s sometimes-extreme difficulty. "At least you don't have to keep a stack of coins on the monitor, to assure your place in line for the next game, like Jeff and I used to do in the arcade," he jokes, noting that for particularly frustrated parties there is a built-in 'cheat code' phone number that lets you start at any level. "We actually included that as a printed instruction sheet in later releases", he adds.

Perhaps surprisingly, Bill notes that he doesn't find the game any easier himself, claiming that he's "always been terrible" at the games he's created. Luckily, *Miner 2049er*'s challenge from a technical perspective didn't stump him, despite it being his first colour game, and nor did he feel limited by the hardware. "I don't think the Atari limited me in any way," he confirms. "Remember that I was a 'black-and-white game without sound' kind of guy, coming from the TRS-80 world, and so the Atari opened up a lot of possibilities." Bill ran with both graphics and sound, turning *Miner 2049er* into an extremely colourful experience, infusing Bob with

Bill's subtle use of colour is particularly apparent when you visit the high score entry screen.

"MINER WAS MY FIRST COLOUR GAME, SO I WANTED TO USE EVERY COLOURED PIXEL I COULD FIND"

BILL HOGUE

plenty of character. "Well, *Miner* was my first colour game and so I think I wanted to make use of every last coloured pixel I could find," recalls Bill. "The high-score screen, where the multi-coloured 'fives' are doing a chaser-border dance around the screen, is probably the best example of my overuse of colour. It took a lot of effort to use display-list interrupts to dynamically change the colour between scan lines to achieve so many different colours on the screen at the same time." As for Bob, he's made up from three Atari players – a blue one for the clothing, an orange one for the flesh tones, and a white one for arms and legs. Various tricks are then used for other graphical effects, as Bill explains "When Bob explodes, the size registers are being rapidly changed from 'X1' to 'X2' to 'X4'; and the glow

effect of the radioactive creatures is created by cycling the colour registers from dark to light and back again." From a musical standpoint, Bill is less happy with his work: "I really hate the music – not the sound choice, but the implementation. Music wasn't my thing, and I really struggled to get the music to be even halfway decent. For the sequel, *Bounty Bob Strikes Back*, I made the smart choice and had another programmer do the music."

Despite the niggle factor of *Miner 2049er*'s audio, Bill clearly loves the game, and in something of a two-finger salute (well, one finger – Bill is American, after all) to the draconian policy followed by much of the gaming industry regarding downloading old games, he made *Miner 2049er* freely available

via the internet. However, rather than just releasing the original game's ROM, he created a standalone *Miner 2049er/Bounty Bob Strikes Back* emulator for Windows. "I made the emulator because some of the general-purpose emulators I'd seen required you to spend time looking for Atari ROMs," explains Bill. "There were also issues that annoyed me, such as flickering colours – I'd spent so much time back in the Eighties tweaking those colour registers to achieve perfection and I wanted to see the game that way again." To ensure the output was faithful, Bill had to emulate each of the Atari's features he'd used in the game. Handily, none of the Atari's ROM functions were used originally, and so the emulator doesn't need an Atari ROM. However, the code had to include the amount of time things would have taken on a real Atari, so all of the original game's timing tricks would work. "The hardest part was probably finding all of the old Atari technical manuals and re-learning all the nuances of the Atari custom chips," says Bill. "Even some of the copy protection stumped me for a while – in the Eighties, I coded things 'cryptically', in an attempt to

confuse anyone disassembling the program. Ironically, I turned out to be one of those people."

The miner legacy

Bill also got the chance to revisit his classic game when Magmic came calling, wanting to update the game for the mobile market (see 'Mobile Miner'). Believing the game to be a worthy prospect – due to its simple, addictive gameplay – Magmic wanted the 'classic' version of *Miner 2049er* to be as close to Bill's original as possible on a mobile phone. "They did a fantastic job – it's beyond cool to see the classic *Miner 2049er* game on a cell phone," enthuses Bill. "Magmic has also discussed taking *Miner 2049er* on to 'future platforms',

and I'd love to see that happen – I think it would be fun to see *Miner 2049er*'s various pieces of special equipment re-imagined in a 3D universe."

For the moment though, Bill has his sights set on other things. Now

working at Technicolor, writing real-time code that controls film printers, he regularly travels around the world to the company's various labs. "I've been to Rome so many times now, I feel comfortable driving without maps," he reveals. Neither does he have anything to do with the games industry any more, although he does note that he's still sort of in the entertainment business. That said, although gaming is firmly in Bill's past, he still thinks fondly about his games, and especially *Miner 2049er*. "I have received so many wonderful letters from people who have told me that my games were a major influence on how they got into the computing business – and that really is an honour. I've also had people write to me to say that their kids are now playing *Miner 2049er*, which is similarly remarkable," says Bill. "Equally amazing are the prices that some of my cartridges fetch on eBay – *Bounty Bob Strikes Back* for the 5200 seems to be the most rare of all. I should have made and kept a lot more of those."

Bill's best *Miner 2049er* memory of all though, involves the time when graphic artist Curtis Mikolyski and he were invited to go to New York to receive an award. "I remember how we both had tuxedos on and went to some fancy party afterwards – it was the kind of evening you imagine the winners at the Oscars having," he recalls. "Later that night, we showed up at the airport for the trip home, only to find out the flight was cancelled and that we had to spend five hours in an airport – still wearing our tuxedos."

"I'VE HAD PEOPLE WRITE TO ME TO SAY THAT THEIR KIDS ARE NOW PLAYING MINER 2049ER"

BILL HOGUE

THE MAKING OF STAR WARS

A LONG TIME AGO, BUT NOT IN A GALAXY FAR, FAR AWAY, ATARI CREATED AN INCREDIBLE VECTOR GRAPHICS VIDEOGAME BASED ON GEORGE LUCAS'S STAR WARS. DARRAN JONES USES THE FORCE TO TRACK DOWN ITS PROJECT LEADER, MIKE HALLY, TO DISCOVER HOW IT WAS CREATED. MANY BOTHANS DIED TO BRING YOU THIS INFORMATION...

The *Star Wars* saga is easily one of the most famous film franchises of all time and has made its creator George Lucas a very rich and powerful man. It also happens to have had more videogame adaptations than any other film – the first, an Atari 2600 re-creation of *The Empire Strikes Back*, was released in 1982 – and, some 31 years later, it shows little sign of slowing down, especially with the recent news that new owners Disney are planning new films. While the franchise has had its ups and downs over the years, it's often delivered some true gems amongst its occasional stinkers. By far the best though is Atari's excellent arcade game.

Impossibly slick, with booming digitised speech and an instantly recognisable sit-down cabinet – a smaller, stand-up version also existed – *Star Wars* was a thing of beauty and remains an utterly absorbing shoot-'em-up and a stunning example of how well videogames could capture the essence of a completely different medium. Amazingly, however, it didn't actually start off as a *Star Wars* videogame at all...

Use the force Jed...

"*Star Wars* came about because I wanted to do a 3D space war game. I mean, I really wanted to do a 3D space war game," reveals Jed Margolin, *Star Wars*' main programmer and the driving force behind the classic game, on his personal website. "It's why I went to work for Atari. Even before going to Atari I had already worked out the math for 3D that did not use

homogeneous co-ordinates. The use of homogeneous co-ordinates just gets in the way of understanding what is really going on in 3D."

"This is a first-person game using 3D perspective graphics."

With this simple sentence – part of Jed's far larger game idea proposal – *Warp Speed* was put forward as a potential game project. This was 14 November 1979. Effectively *Battlezone* in space, the document stated that *Warp Speed* would place the player in the cockpit of a space fighter and would pit them against a like-minded opponent – two cabinets could be linked together to achieve this – while the stars

and enemy space fighter would be handled as three-dimensional projected figures. The computer opponent would self-adjust to the player's skill level and games would be time-based, with the player winning bonus time depending on how well they played. There was even a suggestion to tie it in with a possible

space movie, or *Star Wars II* as Jed called what would eventually become *The Empire Strikes Back*.

Warp Speed was given the green light and Jed began to assemble his team. Greg Rivera was on programming duties, while Ed Rotberg would step in as the game's project leader. But then disaster struck. "Ed, along with Howard Delman, left the company and started their own company, Vidia, which was later bought by Nolan Bushnell and folded into Sente. Greg and I needed a project leader and selected Mike Hally.

"I WAS VERY EXCITED TO BE A PART OF THIS EXPERIENCE AND TO BE RUBBING SHOULDERS WITH THE LIKES OF GEORGE LUCAS"

MIKE HALLY

IN THE KNOW

- **Publisher:** Atari
- **Developer:** In-House
- **Platform:** Arcade
- **Year released:** 1983
- **Genre:** Shoot-'em-up
- **Expect To Pay:** £1,000+ (\$1,800+)

Usually, the project leader selects the team, but in this case the team selected the project leader." After an initial stall, *Warp Speed* was back on.

"Jed was a truly terrific hardware engineer for Atari and had been working on a higher-powered vector graphics hardware since Atari had had some success with games such as *Asteroids*, *Lunar Lander* and *Gravitar*," recalls Mike about his early recollections of working on the game.

"As I remember, I had finished *Gravitar* with Rich Adam and was working on some new game concepts when someone in the licensing/marketing department approached the engineering group to find out if the new hardware Jed Margolin was working on was capable of doing a *Star Wars* game."

Mike was soon hard at work creating storyboards with Dave Ralston, which would not only describe the style and flow of the game, but would be used by Atari to potentially pitch *Warp Speed* to the newly formed LucasGames. After a few internal meetings, Mike was ready to pitch the *Star Wars* game design to the licensing group at LucasGames.

From Warp Speed to Star Wars

"I remember the meeting going very well, and sometime shortly after this meeting I was informed that we had a licence agreement with Lucas to do the coin-

» Clever little message were revealed on the side of the Death Star. Another message reveals the names of everyone involved.

WHAT'S IN A NAME?

Back in the early days of videogaming, Atari was notorious for not crediting the authors of its games. The arcade release of *Star Wars* was no different, so Mike and the rest of the team hatched a cunning plan to ensure that their hard work wouldn't go unnoticed.

Whenever you make the final approach to the Death Star, the huge space station has either 'May the Force be with you', or the names of the team displayed on its side.

"There is a control on the monitor that allows all the lines to become visible so that the operator can make adjustments," reveals Mike about his ingenious idea. "These lines were not meant to be seen. Atari used to be afraid to publish the names of the developers in fear that other companies would steal their talent."

"Normally on the Death Star, as it zooms in, you just see what looks like random dots or lights. However, with a tweak of the monitor you can see the interconnecting lines. If my memory serves me right, Atari management did not know about this until sometime after production was well underway. I also believe that after this the game teams could add in the attract mode, a credit screen listing names and positions of team members like movies did. You need to give 'credit' where credit is due as they say!"

THE GAMES OF MIKE HALLY

MIKE HALLY HAD QUITE AN ILLUSTRIOUS TIME AT ATARI'S COIN-OP DIVISION AS THE FOLLOWING TITLES PROVE

ALL POINTS BULLETIN

■ Released: 1987

■ Role: MLH

Great game that sees you playing a cop who must pull various law breakers within a time limit. It's gameplay could be seen as an early blueprint for the *GTA* series.

BLASTEROIDS

■ Released: 1987

■ Role: MLH

Atari's fourth game in the *Asteroids* series offered a huge boss to fight, plenty of different power-ups and an enjoyable two-player mode.

GRAVITAR

■ Released: 1982

■ Role: Designer

Great little shooter that had impressive visuals and varied gameplay that paved the way for the likes of *Oids* and *Thrust*.

FIREFOX

■ Released: 1987

■ Role: Project Leader

This Laserdisc release was based on the 1982 Clint Eastwood film (which in turn was based on Craig Thomas's 1978 thriller).

GAUNTLET DARK LEGACY

■ Released: 1999

■ Role: Producer/Game Design

This sequel to *Gauntlet Legends* offers several additions such as the ability to make slow and fast attacks, as well as four new characters.

AKKA ARRH

■ Released: 1982

■ Role: Designer/Programmer

Early release that isn't currently emulatable in MAME, so you're going to have a tricky time playing it unless you own an original cab.

AREA 51

■ Released: 1995

■ Role: Game Design

Fairly bland, by-the-numbers lightgun game that tries desperately hard to emulate the success Sega had with the genre but fails miserably.

GAUNTLET LEGENDS

■ Released: 1998

■ Role: Producer

Unlike many games of the time, this fun update of the classic franchise enabled players to use passwords so characters could be saved.

INDIANA JONES

■ Released: 1985

■ Role: Producer

Fun take on the film that has Indy whipping snakes and Thuggee guards, swinging over chasms with his whip and recovering the Sankara stones.

ROADRUNNER

Released: 1985

Role: Director

It's a great use of the *Road Runner* licence, but certain parts are so difficult that all the animations in the world won't stop you from putting your head through the screen.

S.T.U.N. RUNNER

Released: 1989

Role: Overlord

An excellent, fast-paced futuristic racer that combines impossibly slick visuals with fast-paced action to create an exhilarating experience.

EMPIRE STRIKES BACK

Released: 1985

Role: Product Manager

This sequel to *Star Wars* does push the technology – there's lots happening on screen – but it's not quite as fun to play.

operated *Star Wars* project," recalls a clearly pleased Mike. "I was very excited to be a part of this experience with Atari and to be rubbing shoulders with the likes of George Lucas. As far as Jed picking me to be the project leader, I really do not remember how much control he had in this decision, but I'm pretty sure he did have some major input in the final decision."

Warp Speed officially turned into the *Star Wars* project in January 1982, a good 26 months after Jed first pitched his idea. With the game ready to go, Mike and Jed quickly assembled the rest of the team who would take part in *Star Wars*' gruelling 18-month schedule. Earl Vickers took on the duties of audio engineer; Eric Dufrey was the technician, while Norm Avellar was eventually roped

in to assist Greg Rivera on programming duties. According to Jed, the team went through several technicians before they eventually arrived at Eric because "previous techs didn't want to spend their time on a game that was a guaranteed loser". While the tiny team no doubt seems ludicrous in today's climate of huge budgets and large work teams, Mike feels that it was the perfect recipe for success.

"It was really easy to communicate ideas and issues with each other because we were all located in the same lab area," he explains. "We became a family as such, as we spent so much time with one another at work. We had our moments of fighting, arguing, laughing and our moods went through many highs and lows. Greg and I were the only team members married at the time and we both had small children at home. Everyone on this team was very good at their skill so there was a lot of mutual respect for each other. We all

believed in this project so it made it fun to come to work each day and see the progress the game was making. With each step, the rest of the company started to believe in us and saw the product's potential."

It may have all come good in the end, but a hell of a lot of hard work had to be crammed into those 18 long months. It was even trickier for Mike, as the eventual success of the finished game meant that he was still working on it long after it came off the final production run. Unsurprisingly, with such a long gestation period

and small team, the path from small idea to mega-hit arcade game wasn't without its fair share of problems...

"This was the most intense project that I had ever been involved in, let alone being the project leader and game designer," recalls

"WE BECAME A FAMILY, AS WE SPENT SO MUCH TIME WITH ONE ANOTHER AT WORK"

MIKE ON HIS DEV TEAM

Mike. "Every single day was a battle of issues involving every department associated with *Star Wars*' development. From a team perspective, we were up against shared company resources, along with trying to create the impossible. New technology, a game worthy of the *Star Wars* name and a product that would out-earn any other game of the time were just some of the daily pressures we faced. And let's not forget the creation of a brand new controller, voice and music to the mix? Then, of course, there was the added pressure of creating a production-line product with a dead line that just about made us all go insane. Dealing with the licensing group just added another layer of complexity and complicated getting our work accomplished. *Star Wars* was also released in multiple cabinet configurations and was produced in two different production facilities to add to the overall difficulties. UL and FCC approved? The list goes on and

THE FORCE IS STRONG WITH THESE

THE NUMEROUS CONVERSIONS OF STAR WARS

SPECTRUM

While the majority of 8-bit home conversions are fairly respectable, even the most hardcore Speccy fan will admit that this isn't without a few issues. Yes, has some nicely drawn visuals, but the sluggish pace and lack of sound in-game does dampen the overall experience.

AMSTRAD

Considering our Amstrad background, it's somewhat difficult to champion the machine without being called biased. Nevertheless we're staunch defenders of the Amstrad port, even if it does lose out ever so slightly to the far nippier Commodore 64 version.

COMMODORE 64

The graphics are horribly chunky, but there's no denying that this is otherwise a decent port of the classic arcade hit. Boasting a great rendition of the theme tune and solid in-game spot effects, this is great stuff and well worth a quick blast.

ATARI 2600

We've seen some 2600 games suffer from dreadful flicker, but this Parker effort (ironically Atari didn't have the actual rights to produce its own home version of its own coin-op) is truly atrocious. A real pity, as the actual gameplay is pretty good.

ATARI ST

While it's extremely similar to the Amiga version, Commodore's machine just clinches it thanks to clearer speech (there were more samples on offer as well) and sound and far smoother, slicker visuals. It's still a strong conversion of the classic game.

ATARI 5200

Although it boasts some decent visuals, it's very hard to recommend this 5200 effort, mainly because of the truly horrific collision detection that rears its head throughout the game. It's incredibly frustrating to watch TIE fighters not get blown apart.

ATARI 8-BIT

Although there's a fair amount of flickering on display – although nowhere near as bad as the 2600 version – this is a surprisingly good conversion and nips along at an incredibly fast pace. In fact, after some extensive play it's probably become our favourite 8-bit version.

DOS

Its limited colour palette means that it's unable to match the sheer vibrancy of the Amiga and ST versions and the sound is rather disappointing, but this is otherwise a fairly solid conversion. It plays at a decent pace and has great control.

BBC MICRO

We were pleasantly surprised by the BBC Micro version of *Star Wars*, as it's actually pretty darn slick. Faster than many of the other 8-bit versions, with visuals that are somewhere between the Commodore 64 and Amstrad outings.

AMIGA

Many purists will argue that this is actually superior to the original arcade game, and it's very easy to see their point. Mouse control gives you amazing accuracy over your cross hairs; the graphics are extremely faithful to the 1983 coin-op.

COLECOVISION

This is so much better than the 2600 and 5200 ports that it's not funny. Boasting far superior visuals, little flicker and solid controls, this is easily one of the better conversions that's available on the earlier systems.

ACORN ELECTRON

Like many Electron titles, this game plays like a slightly senile relative of the BBC Micro version. It's comparatively sluggish making it very difficult to target the fireballs, but generally it's as faithful as Electron owners could expect.

on... and let's not forget the most important issue of all... this game needs to be fun for every type of gamer out there whether casual or hardcore." Of course, the blessing and curse of being able to create a *Star Wars* game was having access to that actual licence, for while it potentially meant that the game would receive a crucial head start in the arcades, it would also mean that the project would be constantly under the steely eye of George Lucas.

Under a watchful eye

"From the initial meeting with the licensing group to all the follow-up meetings with the games department group there was one consistent theme that the Lucasfilm groups had... they were all very protective of the *Star Wars* universe and every detail had to be accurate," continues Mike. "If I had any element that was not accurate, they instantly made me aware and it had to be changed. Since they were also involved in game development, they did understand some of the decisions that I made."

The team was given a tremendous amount of resources to draw upon and had access to virtually every aspect of the film. They were sent a copy of the original script, numerous toys from which to draw inspiration and plenty of original sketches that pretty much covered every element of the movie. All the music was available for reference – as were numerous voice scripts – the only caveat was that every little detail had to be fed back to the protective publisher.

"The process used to keep them [Lucasfilm] in the loop was to invite them down to Atari to view game development until we had a system that we located on their premises," begins Mike, about the gruelling process. "I would take new ROMS (memory) up to Lucasfilm and replace them in the hardware along with a list of new features this version of the program contained. I would always give a demo of the current game design and discuss what would be coming next. They had to approve all game text, copyright information, cabinet artwork, operator manual and so on. Just think of all the money this company has made on licensing books, games and toys. My last memory of working with Lucasfilm on this project was driving the Atari truck to the ranch to drop off a production cabinet, which was part of the licensing agreement. It was a great feeling knowing that we had accomplished so much and everyone was really pleased with the final outcome."

Although Mike has fond memories of Lucasfilm, he'll be the first to admit that working with a company that had such a fastidious attention to detail meant that sometimes they weren't always on the same wavelength. A typical example is a memo posted on Jed's website, which shows a list of small and seemingly petty changes that Lucasfilm was adamant on having corrected. One note insisted that shields were made of energy, not metal, as pilots wouldn't be able to fight if a sheet of metal obstructed their view whenever they were fired upon, while no 'gunner exists in an

X-Wing because it is piloted by a single person with the help of an R2 unit'. The best, however, was a chastising for using the term 'parcels' instead of 'parsecs', which was then followed by a long explanation saying that even this wouldn't be the appropriate term as even a single parsec would be 3.26 light years and the Death Star wouldn't be visible at that range. With no Earth term being suitable it was suggested that 'light tics' should be used instead. Fortunately, Mike always took these requests in good humour.

"I remember laughing to myself because they were overly consumed with these little tiny issues and we had been worried about some other much bigger issues," Mike recalls about that particular memo. "The team was really relieved to hear back from Lucas and we were glad that their main points were so minor."

While Lucasfilm proved to be far more receptive than the team had originally anticipated, Mike and the rest of his hard-working crew nevertheless found themselves constantly under pressure due to the sheer amount of interest that the potentially lucrative licence

was constantly generating at Atari. "Oh it never stopped," continues Mike about the many challenges that he and the rest of the team found themselves constantly facing as work on the game continued. "There were two main areas of extreme pressure. One was from the company and their need for

"EVERYONE ON THE TEAM CRACKED AT ONE POINT DURING DEVELOPMENT"

MIKE ON PRESSURES FACED BY THE TEAM

this game to get finished and be a huge success, while the other was internal pressure from within the team to be a part of something special and make a name for ourselves. I think every development team at Atari was under a lot of pressure to perform and create magic, but the *Star Wars* coin-op was a new and different venture for us so it just magnified the expectations everyone had. Everyone on the team cracked at one point or another during the development but we all stood the test of time. We eventually went on to work on many other games together so I would have to say that as a team we overcame the fear of pressure and learned to actually enjoy it."

The games

"Do or do not. There is no try"

When you consider how popular *Star Wars* now is, it's difficult to imagine how the eventual coin-op could have ever been seen as anything less than a huge hit. However, when you look at the type of games that were available at the time, the fact that it was released in what would become one of the most trying times for the industry (the great videogame crash) and the technology that Atari was striving to perfect, it's no real surprise that it wasn't always plain sailing. While this wasn't the first vector graphics game that Atari had worked on, it was going to have to be sufficiently more fast-paced than the rather sedate speed of *Battlezone* if it was to capture the exhilarating excitement of the film's final battle. Luckily, this is where Jed's efficiency became readily apparent and the talented programmer ended up making the visuals a little too spectacular.

"Originally, the 3D math that *Star Wars* was capable of performing allowed any object (and the observer) to be in any orientation," confirms Jed. "However, it was eventually decided that players might be confused by being approached by an upside-down TIE fighter, so they were forced to be right-side up most of the time." We ended up going with vector graphics because Atari felt that they were best suited to *Star Wars*' development and what it required based on the original game designs," continues Mike when we asked him about the game's distinct look. "It was one of the first three-dimensional games and at the time it was the only display that we had access to that [could] pull off what we wanted to achieve. At this time in the evolution of videogames almost every coin-operated game had its own custom hardware to maximise the needs for the specific requirements of the game."

Despite the difficulties all of the hard work eventually paid off in rather spectacular style. Few gamers will

"IT HAD THE RIGHT MIX OF ALL THE ELEMENTS IT TAKES TO MAKE A WINNER"

MIKE ON WHY *STAR WARS* WAS A SUCCESS

forget the first time that they saw a whole squadron of TIE fighters roar past them, or how they sat entranced as they watched the towers they were blasting at spin crazily around until the Death Star's ominous looking trench was formed. Massive fireballs exploded in front of your very eyes, Vader's TIE would swoop ominously around the screen, impervious to your firepower, while later runs through that dangerous trench had you dodging numerous barriers that speed towards you at ever-quickening speeds. The simplistic-looking, but oh so striking, vectors created a beautifully immersive atmosphere that was further enhanced by the carefully picked snatches of music and speech that played.

"The Force will be with you, always," "Yahoo", "Use the Force" and "You're all clear, kid" were just a small number of the classic lines that featured and the experience was only heightened by John Williams' wonderfully rousing – if shortly looped – score. For many though it was the beautifully crafted sit-down cockpit and cabinet that helped to give off that true *Star Wars* experience.

And amazingly, it almost didn't happen.

The cabinet was initially equipped with a joystick, but early testing revealed that it confused people, as they didn't know which way to move it. Still, those early test periods proved crucial as it allowed Mike and the rest of the team to secure extra money for a far more suitable controller. "The control yoke for *Star Wars* was a downsized version of the control from *Army Battlezone* (minus the palm switches), which came directly from an actual Bradley Fighting Vehicle (it was the gunner's control)," explains Jed about the unusual controller's original origins. "I wanted it to be based on every child's experience with riding a bike," continues Mike. "It was all about putting both your hands on the handles and pressing the triggers. Everyone immediately knows what to do and no one ever forgets. It was the perfect

Atari kept interest in *Star Wars* high by systematically releasing eraly, tantalising flyers.

player input to play the game and really feel in total control of what you were attempting to do."

Feeling the force

Although the device helped give the finished game that final touch, it was far from perfect as Jed reveals, which explains why the centring for the control yoke isn't always perfect. "Star Wars originally used a Pokkey to read the pots," he reveals. "At that time, people either made their own A/D converter with a counter, a comparator, and a ramp, or they used Pokkey. The Pokkey was a full custom IC designed for the Atari 800/400 to read pots and keys, which gave it its name, 'POTs' and 'KEYs'. Unfortunately, Pokkey does a really awful job of reading pots; it is guaranteed to produce occasional wrong values. The software to deal with it is pretty

MAKING THE CUT

It's rare when all the ideas during the development process make it into the final game and *Star Wars* was no exception. While Mike is more than happy with the end product, a number of ideas never actually made it into the final game. Initially it was going to be possible to have two machines linked up – a throwback to Jed's original *Warp Speed* pitch – but it never happened. While the idea was going to be finally implemented in the sequel, it never came to be.

Perhaps the biggest change that never appeared in the final release was the idea of a timer that would appear in the form of diminishing fuel. Blowing up the Death Star would result in you being rewarded with a completely new fuel bar, while failing to hit the exhaust port would simply see you carrying on the next stage with whatever fuel you had left. It's certainly a bold concept and is a great way of ensuring that one person doesn't completely dominate your machine, but we're glad they went the other way.

Skilled players would shoot the tops off towers in order to earn more points. It's fairly tricky to do but well worth achieving.

» TIE fighters soon start coming thick and fast and launch an insane amount of fireballs at you.

nasty. After Greg Rivera brought this to my attention I took the daring step of actually putting in a real A/D, the ADC-0809. Unfortunately, many people continued to use the original code to treat the A/D values as though they had come from a Pokey. Like Greg. That is why the controller in *Star Wars* keeps getting re-centred."

It wasn't just the software that proved to be an issue, as creating the actual hardware wasn't without its issues either. "The device was a major undertaking for the mechanical engineering department," explains Mike. "I had started at Atari as a mechanical engineer in the Pinball Division so I knew exactly what I wanted and how it could be constructed. The entire project to get this controller into production was crazy. I remember there was a flood in the town where the moulds for the handle grips were being made, so we had to take a rowboat from one building to another to try to get some prototype handles ready for our initial field test."

Indeed, it was field tests that proved to be essential for the success of many early arcade games and Atari was particularly adept at responding to the constructive feedback that was given at these focus groups.

"We had our very first focus group on 24 January 1983," explains Mike about the important event. "The actual gameplay on offer was very rough, as the tower and trench phases were just in the beginning stages of development. Overall though, the players thought the game had great potential and liked the idea of having voices and music playing from the movie. They also thought that a sit-down version of the game would help add realism to the experience."

Responding to the aforementioned issues with the original joystick and the need for a bigger cabinet, work

on *Star Wars* continued and Mike began to tally up the final costs for creating the behemoth cabinet. Total material costs came to an expensive \$1,249.00. A large amount of money for the time, but a positively insane amount of cash when you realise that Atari's game was actually going to be released in one of the industry's most turbulent times. Were Mike and the team not worried about creating such an expensive product during the videogame crash?

"Now that you ask the question it does scare me," continues Mike, "although it was not my job to make sure that the company was financially solvent. Atari had other divisions but I was not sure how the company

as a whole was doing then.

From my perspective, the company shelled out \$1 million for the licence and I never feared for my job so I just felt everything was in fine shape. I was so busy with trying to make this game a success; I was blinded as to the decline in videogame sales for the year. I do remember feeling bad

for our workers in the production building though. If we did not have product for them to build then they did not have a job for a while. I felt somewhat responsible for making sure I did what I could during my career to keep the factory running at all costs."

The beginning of a saga

Despite being released during one of videogaming's bleakest times, *Star Wars* was an immediate success and instantly became the number one selling arcade game, although sadly, this success was short-lived due to *Dragon's Lair* getting released two weeks later. Nevertheless, all the hard work, effort and cost was worth it, with over 15,000 machines being sold for a

grand total of \$15 million, not bad at all for a period that Jed and the rest of Atari described as 'going supernova'. Indeed, Jed is adamant that *Star Wars*' success was the main reason why the arcade division wasn't shut, and it wasn't until the end of 1983 that the team discovered that Atari Games had barely broken even, and that had included the \$15 million generated by *Star Wars*.

The success of *Star Wars* meant that it was soon picked up for home computers. Domark swooped in and released some decent ports, but Mike and his team had no involvement with them. "The thing about being a part of a game development team is that once you finish one game, you roll right into the next one. In the case of *Star Wars*, Atari did a great job in licensing our game to many different home game platforms and if I'm honest I remember getting royalty cheques from them more than remembering which company did what kind of job with our finished game. Atari would always give me a certain number of copies of these games though to give out to team members, which was a class move and a nice motivator."

Although it was followed by two sequels – one with vectors, the later with sprites, which actually came out between the two vector games – neither of them ignite quite the same feelings as their superior predecessor and it's a testament to the game's brilliance and success that it's the only arcade machine we actually happen to have in the office. *Star Wars*, perhaps more than any other licence of the era, was able to offer you an immersion and atmosphere that was second to none, and it's the feeling of actually being within the film that to us, makes it so special.

"*Star Wars* captured the essence of one of the greatest properties ever created for the big screen and beyond," agrees Mike. "It allowed someone to become Luke Skywalker and play an interactive role just like what people viewed on the big screen. It had just the right mix of all the elements it takes to make a winner... For me, it's a true timeless piece of history and art."

LIGHT SIDE, DARK SIDE

After working on such a huge project like *Star Wars*, we were keen to know Mike's favourite and worst moments about working on the classic arcade game.

"One of my biggest thrills was my trip back to New York where I did radio and television spots with our marketing department," Mike recalls. "It was kind of like being a rock star. I was on a television show and got to show off *Star Wars* in a sit-down cabinet that the whole world saw. It was exciting and a very new world for me to be a part of. Receiving my first six-figure bonus cheque at the age of 28 was also a moment that I will never forget. I still remember my body trembling when I opened up the envelope and saw that big number."

But what about the worst moment, Mike? "That's easily the toughest question you've asked me," he begins. "There were definitely many times that I was so tired and fed up with everything that I just wanted to either die or quit, but then something good would always happen. If I'm honest, I can't really remember any one horrific moment. It's funny how things change when you have success, as all you can ever remember are the good times."

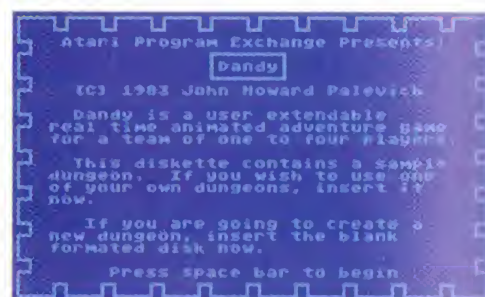

THE MAKING OF DANDY

IT MAY BE OBSCURE BUT, AS GAUNTLET'S MOST PROMINENT INFLUENCE, DANDY IS GRANDFATHER TO DOZENS OF DUNGEON CRAWL GAMES. CRAIG GRANNELL TALKS TO DANDY CREATOR JACK PALEVICH ABOUT HOW IT BEGAN

IN THE KNOW

- **Publisher:** Atari Program Exchange
- **Developer:** Jack Pavevich
- **Platform:** Atari 8-Bit
- **Year released:** 1983
- **Genre:** Arcade Shooter
- **Expect To Pay:** £10+ (\$12+)

A sprawling labyrinthine dungeon crawling with deadly monsters, belched out by generators.

Keys that unlock secured areas of the dungeon. Four brave and hardy warriors, intent on reaching the dungeon's lowest levels, using only their wits, paltry weapons and sporadically found food to aid them.

This might sound like Atari's hit arcade game *Gauntlet*, but we're talking about *Dandy* (also known as *Dandy Dungeon*), a top-down, RPG-inspired, dungeon-based shooter, released for Atari 8-bit systems. And before anyone yells "clone!", *Dandy* arrived a full two years before *Gauntlet* – the arcade game is the clone.

The beginning

Dandy's story begins at the Massachusetts Institute of Technology (MIT). In 1982, Jack Palevich was investigating ideas for his undergraduate thesis. A keen programmer from an early age, Jack initially considered writing an Atari 800 emulator for the MIT CADR Lisp Machine. "It would have been one of the first personal computer emulators," maintains Jack, "but after my thesis advisor stopped laughing at the absurdity of using a \$100,000 machine to emulate an \$800 machine, he asked me to pick another topic."

Along with an interest in computers, Jack liked co-operative gaming, and set about combining the two. "I never played any RPGs," he admits, adding that he didn't have the time, and had far too much fun programming, "but I'd bought the manual sets and watched other people play. I decided I wanted to recreate dungeon exploration pen-and-paper role-playing games on a computer, including the important team-based element".

Influenced somewhat by the Xerox Alto Maze War game – which Jack calls "the very first multiplayer LAN-

based FPS" – in addition to various top-down maze-based arcade games, *Dandy* slowly came together.

"My initial plan included an active dungeon master, at a second computer, who controlled the dungeon, and sent in waves of attacking monsters," reveals Jack, who also invented various foes to roam the dungeon, hand-to-hand combat involving lightsabers, magical weapons, start and end movies, and an ambitious 3D viewpoint, "but I only had three months to write the game, while also still going to classes."

Dandy was subsequently scaled back to meet the tight deadline. The 3D viewpoint was scrapped in favour of simpler 2D levels, and many other components were simplified or removed. Arguably, though, the biggest change was to *Dandy's* benefit. "Due to time-pressure, the dungeon-master console devolved into a simple file server, and once it was just a file server, it made sense to use the Atari 800's floppy disk," says Jack. The importance of this change can't be overstated – *Dandy* suddenly shifted from a complex, multi-computer gaming environment (which, admittedly, was ahead of its time, but unlikely to enable *Dandy* to achieve widespread popularity) to a tightly honed single-machine multiplayer videogame, combining RPG elements and arcade action.

Jack admits that although time pressure often forced his hand, he was by this stage already increasingly thinking about gameplay: "Many of *Dandy's* changes happened in response to playtesting feedback. For example, I used to save a level's state when you left it, so you could go back, because the original idea was for players to go to the bottom level and then return back up. But nobody ever went up, except by mistake, so I took that feature out." The inclusive nature of the development also led to another standout feature: a level editor. "That was a happy accident," admits Jack. "The

first thing I did with *Dandy* was create a big, empty level with a man running around it. On playing the level, it occurred to me that if I had the man leave a trail of shapes, I could use that as a simple paint program to create a level editor."

Design a dungeon

With *Dandy* having a level editor right from the start, Jack was able to get friends to design levels, easing pressure when his own ideas ran dry. "I used a letter to display the level name, and so it seemed reasonable to have 26 levels, but I ran out of ideas long before the end – one level's my signature, 'Hackerjack', and another's a picture of my dog!" Despite the occasional iffy design, Jack considers some of his *Dandy* levels a success: "My favourite is the first level, which was one of the first I designed, as a tutorial on how to play the game. I'm also proud of the final 'Heaven' level, and like the idea of a level full of treasure that endlessly repeats."

Elsewhere, Jack set about fine-tuning the dungeon's contents: a mix of walls, monsters, food and devices to aid players. The monster mechanic in *Dandy* was unique at the time: often appearing from spawners, monsters attack in swarms; monsters also come in three sizes, devolving to the next size down when shot, becoming less deadly. Shoot the smallest monster type and it dies. Much of this design was technically driven, as Jack explains: "Once I decided on allowing a level editor, I wanted to ensure every possible level just worked. I didn't want auxiliary data structures that might limit how many monsters you could use. I wanted to have all the state of the game stored in the 2D array that was used to display the level. So each monster was represented by a single number, which was used directly by the Atari hardware to draw the monster's graphics. When a strong monster took damage, I'd

You'll be collecting all sorts of things in *Dandy*, so don't miss your chance to pick stuff up.

The games

Level C introduces the first enemy spawners, resembling skulls, ramping up Dandy's difficulty level significantly.

For Jack, enabling four players in Dandy was the heart of the game: 'It was all about re-creating the RPG dungeon party experience'.

RUN THE GAUNTLET

Dandy and Gauntlet are poles apart aesthetically, but on playing both games, their similarities are apparent. Both offer simultaneous and slightly awkward four-player modes; both enable you to rampage around a scrolling dungeon, killing monsters that spew forth from generators; and both offer a key/locked door model, along with peppering the dungeon with health-boosting food, which has mysteriously managed to stay fresh in putrid conditions.

Most of Gauntlet's changes were designed to suck coins: health levels constantly dropping, immediate food consumption, a lack of player resurrection, and more frenetic gameplay. That said, Gauntlet also added important ideas to the mix, including distinct monster types, and melee attacks for hand-to-hand combat. It's likely, though, that Gauntlet's sheer success, rather than amended gameplay mechanics, are what led to it becoming a 'template' for an entire genre, at the expense of the obscure Dandy.

replace it with a weaker monster, and so on until it was destroyed. It was then simple to use three different graphics for the different levels of monster health."

The spawners arrived from a need to make levels harder, and were inspired by the cellular automata of Conway's *Game Of Life*; but monster swarms, where the player rapidly finds themselves surrounded, came from nothing much at all. "When I created Dandy, I was unaware of the likes of *Rogue* and didn't have ideas for monster behaviour beyond 'run right towards the player,'" laughs Jack. "If I'd known about *Rogue*, maybe Dandy's monsters would have been more interesting!" While never interesting, Jack reveals the monsters sometimes at least became odd during playtesting: "There were bugs where the monsters all ran away

from you, or ran at right angles, resulting in orbiting monsters! In retrospect, I should have used these bugs to implement 'scare monster' and 'confuse monster' spells!"

Final pieces of the Dandy puzzle centred around ensuring games lasted a decent while. With up to 30 per cent of your health removed on hitting a

monster, food was sprinkled around each level. Unlike the later *Gauntlet*, Dandy enables you to store food, saving it for when it's most needed. "Notice that eating food always maximises your health," says Jack. "I wanted the player to decide how much they wanted to gamble on using food – should they wait until their health is low, but then risk dying from a single monster bite?" But even death is not the end in Dandy, since shooting resurrection hearts enables players in 'limbo' to return. "The heart was one of the game's last additions. It was added because during playtesting people would start a game over once a party member died. Adding the hearts encouraged the party to keep going, and gave players a nice side-quest."

Dandy integrates a level editor, enabling you to rapidly fashion your own dungeons.

"THE FIRST THING I DID WITH DANDY WAS CREATE A BIG, EMPTY LEVEL WITH A MAN RUNNING AROUND IT"

JACK PALEVICH

With his game complete, Jack got an 'A' on his thesis, and Dandy was subsequently released through the Atari Program Exchange. But the future for Jack and Dandy became turbulent when Atari's arcade division unleashed Gauntlet. Strikingly similar to Dandy (see Run The Gauntlet'), Atari's arcade game led to Jack taking legal action to ensure he retained the right to further develop his own creation. "Atari really took advantage of me," he says, ruefully. "To be honest, IP laws weren't very clear in those days, and also MIT owned the rights to my thesis work, and wasn't interested in pursuing claims against Atari."

Jack says his biggest regret, aside from possible lost royalties, was not demanding a 'designed by' credit in Gauntlet itself: "I asked for it, but Atari cleverly put me

off with the excuse that the ROMs had been burned. Unfortunately, I didn't think of requesting a credit in future revisions of the game." We ask whether Jack feels slighted by the incident, and whether he thinks Dandy has been wrongly overlooked as father to entire genres, in favour of Gauntlet – especially

given that many of Gauntlet's gameplay mechanics originated in Dandy. "My friends and much of the game design community know about Dandy, and so I don't really mind. Also, after Gauntlet 2, the Gauntlet franchise moved away from Dandy. I don't think current versions of Gauntlet have much to do with my design."

Gauntlet also pops up when we ask what Jack would change in Dandy, if he ever had the chance to go back to it: "That's a good question. Most of the obvious improvements were done in Gauntlet – things like adding character classes, more types of monsters, changing the environment sprite set on different levels, adding in synthetically generated levels, character classes, better animation, more kinds of loot, and so

on... But I think if I had to do *Dandy* again with exactly the same time and design budget, I'd put in differently shaped levels, and a few more types of monsters. And it might be worth creating a shop – the money you collect is currently useless!”

Expanding out

Today, Jack remains immersed in the world of technology, and worked for seven years at Microsoft on graphics libraries and tools for the Xbox and Xbox 360. More recently, he wrote the ‘Street View’ Google Maps 3D viewer for the Android smartphone. With a family to support, Jack says he has little time for writing games as a hobby, although it's clear *Dandy* never entirely left him. “I like learning new programming languages, and when I learn a new language or library, I often try to implement *Dandy* in it, to get a feel for whether the language is a good fit for videogame programming.

Unfortunately, no version of *Dandy* has yet appeared on a modern console, and Jack's unsure whether that will ever change: “One problem I've run into in developing *Dandy* for modern consoles is that most of the obvious incremental improvements, such as improving the way characters move, or adding more kinds of monsters, actually make *Dandy* more like *Gauntlet* – and that's just not a direction I want to go in. I don't want to just copy that game, and so I feel that I'd have to work for quite a while to move beyond the *Gauntlet* design space and strike out into new territory.”

TOGETHER IN ELECTRIC DREAMS

Dandy resurfaced in 1986 on major home computer formats. Bearing little direct similarity to Jack's game, the update instead ripped off *Gauntlet*, resulting in a legal spat between publisher Electric Dreams and Atari, causing myriad irony machines to explode.

Although the Z80 versions are fine, the C64 port is iffy, and programmer Nick ‘Orlando’ Pelling reveals why: “*Dandy* was written by a bunch calling themselves ‘The Ram Jam Corporation’, who promised Electric Dreams a C64 conversion by Christmas. Time passed, nothing turned up. Electric Dreams pulled the plug and asked me to give the C64 version a go.”

Although he'd never programmed the C64, Nick took on the challenge, considering *Dandy* a simple game: “I knew 6502 assembler inside out, had access to a dev-kit, and worked for six days without sleep, took a day off, and worked for another six days to get everything working. Despite the mad effort, Electric Dreams messed up the packaging and were unable to get it out for Christmas anyway...”

“I LIKE LEARNING NEW PROGRAMMING LANGUAGES, AND WHEN I LEARN A NEW LANGUAGE OR LIBRARY, I OFTEN TRY TO IMPLEMENT DANDY IN IT, I GUESS MOST PEOPLE WOULD USE TETRIS OR SNAKE INSTEAD!”

JACK PALEVICH

— The final dungeon level is ‘heaven’: full of cash, but endlessly repeating.

THE MAKING OF CRYSTAL CASTLES

WHEN FRANZ XAVER LANZINGER CREATED A GAME THAT WAS AS DISTINCTIVE AND MEMORABLE AS HIS OWN NAME, HE BEWITCHED MANY AN ARCADE GAMER. PAUL DRURY VENTURES INSIDE THE WALLS TO DISCOVER HOW THE STATELY CRYSTAL CASTLES WAS BUILT

Franz thinks very carefully about the question before answering. "Well, I had studied his work. In fact, I have some of his pictures on my wall in the office right now. And that one maze called Impossible Staircase uses the same technique of building something in 3D that looks possible but isn't... Yes, Escher was a very strong influence."

Retro Gamer has tentatively ventured into chin-stroking territory. The distinctive visuals of Fran Xaver's excellent arcade hit *Crystal Castles*, those strange 3D structures that rise majestically from a flat plane as each level begins, do recall the work of the Dutch graphic artist famed for his playfulness with perspective. Is this perhaps the first example of a game designer who had a clear artistic ambition? Did Franz liken himself to famed artists?

"No I didn't think of myself as an artist back then," chuckles Franz, self-consciously. "I was just trying to make a fun game. Deal with the technical issues and fix the

bugs! I was and still am a gamer and it's all about that." Sorry, bearded academics, but Franz is one of us.

Decisions, decisions...

After dropping out of a mathematics degree at the University of California at Berkeley to pursue a career in scientific research, Franz had been leading a double life. One that hinted at why *Crystal Castles* is such a good game. "I was programming by day, playing arcade games by night. I had a group of friends and we were playing a lot of games in 1980 and 1981. One of our group, Brian McGhie, got hired by Atari because he was part of a focus group recruited from a local arcade field test. He recommended me. And Atari were the big cajones, so to speak. Like working at Disney if you wanted to do animation."

While Franz's prowess on *Centipede* must have looked good on his CV, it was his experience in coding

in assembly, still the primary tool for developing arcade games in those pre-C days that landed him the post. Franze ended up joining Atari in early 1982 and immediately began work on the project that over the next year and a half would eventually evolve into the sparkling *Crystal Castles*, a game with no obvious antecedents. Well, you could argue that the gem-collecting premise may owe something to *Pac-Man*'s pill-popping, but discovering that *Crystal Castles* actually began life as a follow-up to Ed Logg's *Asteroids* comes as a pleasant surprise.

"It was internal politics. In order to get a project off ground, you had to choose an approved project from the 'Big Book'. Atari did these annual brainstorming sessions for the entire engineering department and would write down game ideas in this book. When I arrived, I looked through the book and picked one."

Franz's fingers fell on *Toporoids*, a re-imagining of Atari's seminal vector blaster. The new employee was without a full development system for the first few months at the company and so spent his time mucking about on the huge mainframe that was there, creating 3D backgrounds for the space-based shooter – the 'topology' part of the game's rather strained title. Needless to say Franz found himself doing plenty of experimentation.

"Almost from the beginning, the backgrounds looked like they would in the final game," he says about the gruelling process and many changes that his game was going through. "They were data driven – I'd type in numbers for the heights and colours of these 3D structures, the timing of lifts, the placement of tunnels and so on. It evolved from day to day. I remember having 2,000 versions of the game. I'm not kidding! Every day I'd make four or five versions. I'd try each one out and an hour later, do another one."

It would turn out that experimentation was the key to success with *Crystal Castles*, as was the addition of a small E.T.-like creature, which allowed Franz to scurry across the architecture of his mysterious isometric world. Once he had scattered gems across the landscape for the little fella

"IN 1983, I SPENT \$2,000 IN THE ARCADES. BEING A GAMER AND BEING PART OF THE GAMING CULTURE ALLOWED ME TO MAKE GOOD DECISIONS ABOUT GAME DESIGN"

FRANZ KEEPS IT REAL

to collect, he could see the potential for a very different sort of game than interstellar rock reduction.

"That's when it took a different direction to *Toporoids*. You could see there was a fun game in there, but we didn't have a theme or enemies. A group of us threw around

ideas and came up with a fairytale theme. The witch, the moving trees, that idea of them being alive like in the *Wizard Of Oz*... and the bear. You find them in the woods."

And we all know what bears do in the woods, though the unlikely hero of this tale was careful

not to cause offence. "He was going to be called Bear Braveheart until someone in marketing decided it was politically incorrect because of Native Americans," says Franz. "There was something going on with the Atlanta Braves at the time and the word 'Brave' wasn't considered kosher. They had a competition open to all in engineering to rename him and Bentley won. Not my suggestion!"

Crystal chasing

Our newly christened, PC-friendly leading bear was now free to snaffle up the tempting crystals and progress through the game's 37 screens. He wasn't without competition though, as equally avaricious gemeaners roam the mazes, though it's possible to eliminate them mid-gobble. Add to this Berthilda on her broomstick, wandering trees, crystal balls and an angry swarm of bees and things can get pretty crowded. This is when you thank the game's incredibly speedy and precise controller for allowing you to outmanoeuvre your adversaries with a well-timed spin of the glowing trackball.

"I was playing a lot of *Centipede* and *Millipede* was in development in the lab next door. I liked the trackball controller. I felt comfortable with it and the management said I could choose – trackball or joystick – so that's what I went with and didn't really think of the implications. In retrospect, having a trackball is a hindrance as it's hard to get the feel right with a different controller..."

True, designing the game around a joystick may have made future home conversions easier to implement, but

Bentley's nemesis got her name when Franz was driving down Highway 101 and saw a sign for 'Mathilda Avenue', which he thought 'sounded like a witch'. He played around with it a little and the evil Berthilda was born...

It's easy to dismiss *Crystal Castles* as a simple *Pac-Man* clone, but that would be foolish. While there are certain similarities, the isometric setting means you have to tackle *Crystal Castles* gameplay in a completely different way.

THIS IS THE END...

Franz had to fight his corner when it came to having an end to his game, but the opposition didn't come from the players pumping in the quarters. "They were fine with it," he explains. "Basically, management had had huge success with games like *Asteroids*, which didn't have endings, so why rock the boat?" Ever the diplomat, Franz eloquently stated his case through a detailed two-page memo, arguing the benefits of giving *Crystal Castles* an end screen. It's a fascinating historical document, touching on ideas such as if videogames are aspiring to tell stories, they should have satisfying conclusions in the same way novels do, and we are delighted that Franz has now chosen to publish his 25-year-old document on his website.

Go to www.actualentertainment.com/crystalcastles where you can read it in its entirety and also download the very sweet *Gubble HD*, for a price of your choosing. While you're on the wonderful web, please visit Mark Alpiger's www.classicarcadegaming.com for his superlative pages on *Crystal Castles*. "He's a tremendous player and he really knows the game. Better than I do, in fact," acknowledges Franz. "He's been a great inspiration over the years. His website is amazing. A lot of great information. And yeah, I've seen the footage of him playing *Crystal Castles* with his feet on the extras of *The King Of Kong DVD*." We featured Mark in issue 36 and have had the rare privilege of smelling his sock after he defeated Berthilda. At RG, we go the extra mile.

The Hidden Spiral stage contains the initials of fellow gamers Desiree McCrorey, Sam Mehta and Brian McGhie.

Franz played around with perspective on the game's final screen, which was entitled rather appropriately 'The End'.

many of the nuances in gameplay – the way Bentley can take corners at a blistering pace, his pirouetting descent of crystal encrusted towers and the rhythmic swirls of expert players as they swallow up fields of gems with some nifty finger work – all rely on the esoteric charms of the trackball. If you don't believe us then play *Crystal Castles* today on the likes of *Game Room*, which can be found on Microsoft's Xbox Live service, and see for yourself. Franz was simply intent on making the best game he could for gamers of the day and though he had crossed over into game development, he wasn't one to forget his roots.

"I felt it was important I kept up my arcade playing. In fact, I remember using a tax write-off of \$2,000 for money I spent in arcades in 1983! Research and development. I don't feel bad about it. I could have played all the games I wanted to at work for free, but I felt it was important to go to the arcade. Being a gamer and part of the gaming culture was helpful. It helped me make good decisions about game design. It pushed me in the right direction."

His immersion in that culture, where your status was determined by the position of your initials on the high-score table, is beautifully evident in the very architecture of *Crystal Castles*. The three-lettered tag of the day's best player is incorporated into the towers of the opening level and Franz's favourite screen, entitled Hidden Spiral,

is formed from the initials of three of his gaming friends, including Brian 'BBM' McGhie who'd helped him break into

Atari in the first place. Look closely at Berthilda's Palace and you'll see 'EDG' and 'MAR' carved into the floor, standing for Eric Ginner and Mark Robichek respectively, who were both high-scoring heroes from the Golden Age of videogaming in the Eighties.

"I watched Eric Ginner play *Tempest* and even with the scheme that let the advanced players select which level to start from, it still took him half an hour to get to the level of play he wanted to be at," recalls Franz. "I wanted you to get there right away! That was part of my motivation for putting the warps in *Crystal Castles*. Plus, I wanted to do something to keep the game times low. Put something in there to ensure the game time was five minutes or less. Basically, monetary greed!"

It's warp time

From his hours in the arcade Franz learned how to meet the needs of the expert, while not alienating the newbie and hid three warps at strategic junctures in the game. And of course, everyone loves uncovering secrets. The first time you guided Bentley to the rear corner of the opening screen, jumped, and then watched in wonderment as your furry friend rocketed into the ether leaving those early levels behind was a revelation for many a young gamer. Even today when you return to Atari's classic game,

"I WAS PLAYING A LOT OF CENTIPEDE AND MILLIPEDE"

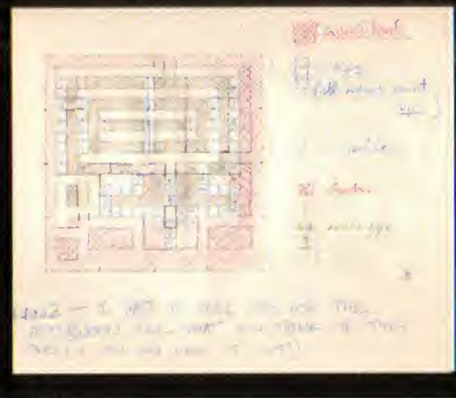

FRANZ XAVER

WITH A LITTLE HELP FROM HIS FRIENDS

While all the game code for *Crystal Castles* was written by Franz alone, he did have some input from the two graphic artists Atari employed at the time. "Barbara Singh did the bulk of the motion objects and Susan McBride also did a few," he notes. "You'd call them sprites now – the bees, trees, ghosts and, of course, the bear." This female touch may go some way in explaining Bentley's rather effeminate garb of red boots and red sash, topped off with a rather fetching hat (which, to be fair, does provide five seconds of invulnerability from enemies, including, hopefully, the fashion police).

Fellow Atari game designer Dave Ralston also helped design some additional mazes after prototypes were placed in local arcades. "At the first arcade field test there were 12 different mazes that I had designed and feedback from players was that they wanted more. More variety. Dave helped with the more complicated mazes you see later in the game. I still have his original drawings. I plan to give them back, erm, any day now!"

Fortunately for us, Franz has kindly scanned these sketches before returning them to their author and *Retro Gamer* can exclusively publish them here. We particularly love the scribbled message left for Franz... hope you had a good afternoon, Dave. Nice work.

Having fought and won, the player is rewarded with plenty of points and lots of blocks...

Franz tackling his own creation in 1986. Photo courtesy of CC aficionado Mark Alpiger.

rediscovering those clever little secrets can deliver the sort of thrill that most of today's releases just can't seem to manage, so we were eager to find out the origins of those clever little warps.

Franz smiles and tells us: "I wanted something that you'd learn. The beginner wouldn't know about them and eventually he'd get a message about the warps. Most people think you had to read about them in magazines, but I [would] put messages in the game. If you play straight through and get past the place where you can warp to, there's a message telling you."

This innovative feature pre-dated Mario's Warp

Zones of course, but it wasn't the only piece of prescient thinking. *Crystal Castles* is the first arcade game to offer a distinct ending. This was something very new for an action game and Atari's top brass needed convincing.

"Management saw that they got a lot of free publicity from people playing *Asteroids* and *Missile Command* for days on end," says Franz. "It was all about marathoning, but I felt strongly that the score in a game should be meaningful. I felt it was important to have an ending..."

Hidden messages

Franz persuaded his bosses through a detailed two-page memo (see 'This is the End') and thus those triumphant players who beat Level 10, Screen 1, are rewarded with a congratulatory message, a rating determined by how many lives they have left ranging from 'Amazingly Good' to 'Video Wiz', a bonus score based on speed of play and a rather fancy little animation that fills the screen with reproducing rectangles.

It's another sweet touch in a game full of little details. The outlandish use of pink, maroon, peach and pea-green in a palette that would please Laurence Llewellyn-Bowen (Franz exclusively reveals he put a counter in the game so the colour scheme changes every 1,000 games). The naming of each level adds real atmosphere, as you first discover Berthilda's Dungeon, the ominous Doomsdome or the helpful hint of Hidden Ramp. The cute cartoon speech bubble that contains Bentley's last words when he cops it. And then there's the cabinet itself, complete with illuminated trackball and elaborate side-art.

Crystal Castles turned heads when it arrived in 1983, but it was to be Franz's only contribution to the arcades

The spiritual sequel of *Crystal Castles*: *Gubble HD*, available from Franz's website www.actualentertainment.com.

he so loved. He spent the following year working on a *Gremkins* arcade game, spending time on the film set and meeting Spielberg, but then left Atari over a dispute about the lack of residuals paid to coin-op developers for sales of home conversions of their games. It remains his biggest gaming regret.

He left the industry for five years before joining Tengen

in 1989, where he converted *Toobin'* and *Ms Pac-Man* for the NES. He went on to form Bitmasters, who released *Krazy Kreatures* and *Rampart*, before stepping up to the SNES for *Championship Pool* and *Final Four Basketball*. Then in the mid-Nineties,

"ATARI WERE THE BIG CAJONES. IT WAS LIKE WORKING AT DISNEY IF YOU WANTED TO DO ANIMATION"

FRANZ ON GETTING TO HANG OUT WITH THE BIG BOYS

he teamed up with old arcade buddies Mark 'Frogger' Robichek and Eric 'Centipede' Ginner to set up Actual Entertainment. "The idea was to do a sequel to *Crystal Castles*," he says. "We couldn't get the rights, so did a game that was similar but different enough to avoid legal problems. And I was very happy with *Gubble*. I think it's a great game. In fact, I recently did *Gubble HD: Anniversary Edition* and I'm trying to get it out on other platforms. I think the DS would be a good platform for *Gubble*."

So the seasoned game designer has returned to the spiritual successor of the game that launched his career. Does his first-born remain his favourite, though? Franz laughs. "Yes. It had the most impact and originality and I'm proud of it. I saw it in *The King Of Kong*, which was a big thrill. Actually, *Crystal Castles* was the first game I ever wrote. I'd done a lot of programming – I'd been doing it since 1971 – but nothing I did at school or work was a game." Debuts don't come much more auspicious...

This rough sketch by Franz shows the debt he owed to Escher and clearly influenced the 'Impossible Staircase' and 'The End' screens of *Crystal Castles*.

THE MAKING OF PAPERBOY

WHEN PAPERBOY RODE IN TO ARCADES IN 1984 HE BROUGHT WITH HIM COLOURFUL CARTOON VISUALS, A UNIQUE CONTROL METHOD AND FUN GAMEPLAY. DARRAN JONES SPEAKS TO CREATORS JOHN SALWITZ AND DAVE RALSTON AND FINDS OUT HOW THEY MANAGED TO CREATE THE ULTIMATE BUSMAN'S HOLIDAY

It's amazing what effect alcohol can have on you once it starts swirling around your innards. Some people get an increased sense of confidence, feeling they can do anything, while others suffer from a lack of judgement that sees them making decisions they'd otherwise normally never consider. In the case of John Salwitz (who is currently senior development director at Electronic Arts) and Dave Ralston (a designer for Locomotive Games) the aforementioned alcohol consumption allowed them to overcome a stumbling block on one of the most popular games of 1984: Atari's *Paperboy*.

Beer Fridays

"Back in those days Atari was famous for having Beer Fridays," laughs Dave Ralston who, along with Will Noble, was *Paperboy*'s designer and lead artist on Atari's new project. "We had a tapster there on the premises and one particular Friday there had been a party; when John and I came in the next day there was still plenty of beer in the keg. Anyway, we dragged it outside onto this atrium and did some brainstorming."

"I think that was the magic moment when everything clicked," agrees Salwitz, who was *Paperboy*'s lead programmer. "Dave had these wonderful storyboards

that showed a projection of the entire street and we literally populated it that very day. We probably knocked out around 60-70 percent of where all the characters in the game would finally end up."

"We were probably stupid for never doing that sooner," laughs Dave about the entire incident. The laughter continues throughout our interesting 40-minute interview and it soon becomes obvious that the two friends both have a huge amount of respect for each other, as well as the videogame that they brought kicking and screaming into the arcades after a 24-month gestation period. But where did the concept come from?

IN THE KNOW

- **Publisher:** Atari
- **Developer:** John Salwitz, Dave Ralston
- **Platform:** Arcade
- **Year released:** 1984
- **Genre:** Action
- **Expect to pay:** £350+ (\$800+)

"There had been a game that had just come out in the arcades called *Zaxxon* which had this really cool isometric perspective and it felt really fresh," recalls Ralston. "We saw it and realised that the isometric perspective would offer a very good view of the action in our game and that it would work far better than a side scroller or a top-down. As for the game itself it grew out of the fact that there were five boys in my family and I was the last one and we were all paperboys, so I just took it from there. I think I was a really good paperboy. In fact, I seem to remember that I was a great paperboy," he continues. "The one thing I can remember about those days is driving around as a family and seeing newspapers on roofs and in bushes and stuff. Not everyone was a good paperboy in real life and I think that was at the heart of the idea. I just thought it would be an interesting twist for a game."

And interesting *Paperboy* most certainly was. Most games of the time saw you shooting down wave upon wave of vicious aliens, negotiating mazes or jumping across simplistic platforms; they certainly didn't allow you to participate in your part-time job.

Set over seven days, your task was to deliver papers to subscribers, while causing as much damage as possible to the homes of non-subscribers. Papers could be replenished en route and once you'd completed your daily round you could take part in a short but exhilarating obstacle course. It may have sounded simplistic, but with each street being littered with obstacles it took real skill to negotiate them, especially if you tackled 'Hard Way', *Paperboy*'s final street.

Paperboy may have been exciting and fresh back in the early Eighties, but those beautiful visuals, state-of-the-art controller and slick gameplay did come at a price:

the aforementioned lengthy 24-month time period...

"It took two years mainly due to some of the changes we had to make along the way," explains Ralston. "It was pretty much everything really, from changes in the schematic style, to alterations to the actual controller. It certainly took us a while to figure all those things out."

New hardware, new freedom

Fortunately, it wasn't all bad news, as one of the main differences – and for the two men, the most satisfying – was the change in hardware, which gave Salwitz, in particular, far more freedom than when the project had first started. "Originally *Paperboy* started off life as a low-resolution game (about 320 x 240 pixels) before Doug Snyder created the new medium-resolution System II board for it," begins Salwitz. Which explains why it looks very different to earlier games of the same period. "The hardware changed substantially and schematically, it basically went through a radical shift."

As well as having to deal with the change in hardware, the cost of the machines meant that the game had to be created as efficiently as possible, which in turn added to *Paperboy*'s development time. "That game is literally made up of little 8x8 blocks," continues Salwitz. "The backgrounds were painstakingly created one by one; it's a lot like building with bricks, except

the bricks have already been painted. The animations and characters were built using some pretty primitive tools, and so due to the cost of putting all that together, we couldn't really do a lot of extra things and we were very deliberate when putting it all together."

Paperboy's conception may have been long and arduous, but one thing that did make a difference was the sheer amount of playtesting that the game went through. Over the course of its two-year development time, *Paperboy* went through numerous focus groups and playtests before it was eventually released to a more than satisfied public.

"WE DID HAVE A JOYSTICK ORIGINALLY, BUT WHEN WE FOCUSED THE GAME WITH [IT] IN PLACE, IT JUST DIDN'T GO DOWN WELL AT ALL... WE WANTED TO TRY SOMETHING A LITTLE MORE UNIQUE"

DAVE RALSTON

As the week progressed, the obstacles got harder and harder to negotiate.

JUST A BIT OF FUN

Don Traeger may well have been instrumental to *Paperboy*'s eventual success, but that didn't mean that Ralston and the rest of the team liked to make things easy for him (all in the name of a good joke, you understand). "I remember that we made this bogus earnings report for him," recalls Ralston, which instantly jogs Salwitz's memory and sends him into guffaws of merriment.

"It was our first field test when you'd put the game out in an arcade, and I think Don must have gone on vacation right after it happened. Anyway, he went away for a whole week and while he was absent we got somebody in marketing (probably Jackie Sherman) to type up an earnings report so that it looked like all the others, except of course, the earnings were horrible.

It just showed that the game had absolutely tanked and then I just wrote across the front of it 'Project Cancelled'. We just left it on Don's desk and waited for him to come back from vacation. It was far from the truth as it actually tested very well."

While you scored points for breaking the windows of non-subscribers, care had to be taken not to hit any others.

It's important to remember to get as many points as possible in *Paperboy*. Here we are getting a bulls-eye!

The games

When Atari had a new game in development it would simply take a prototype down to an arcade, leave it in there for the day and judge its success on the amount of quarters it took. It was a concept that wasn't lost on Salwitz and it allowed for another of *Paperboy's* players to enter the fray: marketing rep Don Traeger.

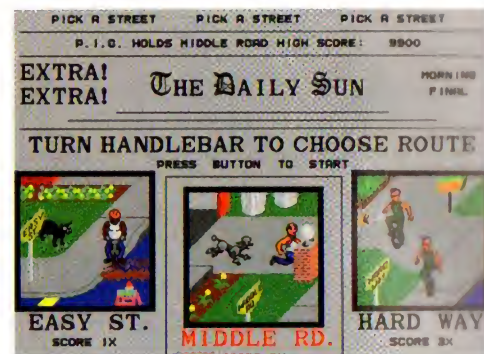

"Atari's playtesting process was the most beautiful test there was; it really doesn't get any better," gushes Salwitz. "We did a lot of focus group testing as well and that was where Don Traeger really started to get involved. In fact, Don is a very big part of the reason why *Paperboy* ever got finished, because he was not only the original marketing partner on it, but he also came in at a point in the game where we were really struggling.

"We'd just had this really horrific focus group, and it was just heartbreaking and frustrating for the team because we really cared about the product we had created. So anyway, he came in, ran that focus group, came out and everyone – I mean everyone – was saying horrible things about the game. Afterwards he comes out with this really big smile and says, 'That was great, we

learned a lot from that.' After that he proceeded to help us really understand what was going on."

Traeger played another important role in *Paperboy*: that of the actual Paperboy himself. Asking about the origins of *Paperboy's* speech brought many a laugh from Ralston until he admitted that the main character's voice belonged to none other than Traeger, who's now CEO of Locomotive Games. But how does being the voice of a videogame character stack up to being a CEO? "To this day he takes a lot of pride in the fact that he was the voice of the Paperboy and people still remember him for that," laughs Ralston. "It was no actor we used; it was just the marketing guy."

While Traeger started taking control of *Paperboy's* focus groups, Ralston and Salwitz quickly found out that one of the easiest ways of getting feedback for the game was to simply carry on working on it. "One of the other key ways that you did testing at Atari was that if anyone was going to walk over to your lab or cubicle you would just let them play the game, which is amazingly dissimilar to the way things happen these days," says Salwitz.

"There was just so much casual play from other people in the building that I think it was one of the best ways that you could ever understand what really did and didn't work. You could tell your game was good because people were coming over at lunch and were literally interrupting your work just so they could have one more go. We'd just sit there and watch them play."

Playtesting and more playtesting

While lots of playtesting ensured that *Paperboy* was a hit with its target audience once it was eventually released, there were still problems that the team to solve. While the most recognisable aspect of the arcade machine is the shining chrome handlebars that adorn the front of it they weren't in place at *Paperboy's* conception.

"We did have a joystick originally," begins Ralston, "but when we focused the game with the joystick in place, it just didn't go down well at all."

CONVERSION OFFERS

With the arcade game proving to be so popular, *Paperboy* quickly started appearing on various home consoles and computers. Indeed, it was recently released on the 360's Xbox Live Arcade, but neither Ralston nor Salwitz have had a chance to play it yet.

"I remember the NES version, for me at least, being a huge surprise," recalls Salwitz. "Right after we did *Paperboy*, we dove into *720°* and right after that it was *Cyberball* and right after that it was *Rampart* – we were just so focused on our own work. We never thought about how we could continue marketing a product, we were all about what can we do next, and it always had to be completely different. If I'm truthful we were coin-op purists and for us, coin-op hardware was so much more powerful than anything that was in the home. So I think the real truth is that we probably looked down our noses at anything that wasn't coin-op at the time, purely because of the difference in hardware and what you could do with it. At the time I don't think we understood the potential of home sales – this was Atari after all – and we had just got through the VCS nightmares and so we didn't really have an appreciation of what Nintendo was doing at the time at all until it really took off."

"I think the joystick was confusing at the time because of the perspective that we were using," he continues. "We had always had something at the back of our minds that we wanted to try something a little more unique and the joystick feedback that we received kind of confirmed that." Leaving the joystick idea behind, Salwitz and Ralston left the unique control mechanism – "it was basically a Star Wars flight controller that was just modified for *Paperboy*" – in the more than capable hands of Milt Loper.

"Atari at that time had a very active mechanical shop," begins Salwitz, when we ask him about the creation of those iconic handlebars. "It was amazing; those guys could pretty much build anything and it was part of Dave's philosophy that we should always try and innovate in all things. In the end we decided that the controls were just another area that we had a chance to innovate in. You also have to keep in mind that back in the early Eighties, we didn't know for sure that even the joystick would become a foundation for control, or the trackball for that matter. We just saw them as kind of stepping stones to other controls. In the end it turned out that the handlebars themselves made for the most natural way of playing *Paperboy*. We never tried to create them as a way

As a reward after finishing your paper round, you got to ride along an obstacle course. Time to test those BMX skills.

of simply increasing sales; it has always been about what was best for the actual game."

With *Paperboy*'s controls system now decided, one other factor had to be taken into consideration:

namely, would the chrome handlebars be strong enough to withstand the vigorous assault of an arcade gamer?

"There was a guy at Atari called Dave Stubben," begins Ralston, which immediately causes Salwitz to burst into fits of laughter as the story begins. "He was one of the senior execs at Atari games, and he was a very big, very strong guy. And in all the controls that we used there was always this thing called the 'Stubben rule'. Basically,

if the controller could survive Dave then it was going to be okay.

So obviously with this controller, this piece of chrome steel that was bolted onto the front of the machine had to be really resistant to leverage and anything else you could think of."

While the final handlebars eventually passed the test with flying colours, Salwitz recalls an earlier prototype that didn't fare quite so well...

"The funniest story I remember is that Mark Cerny came into the lab one day and we had just gotten this brand-new controller in

At the beginning of each day you'd be immediately told how many subscribers you had left.

Successfully finishing the obstacle course saw you being treated with a pleasant congratulations screen.

that we were very excited about it. So anyway, I looked at Mark and told him, 'You just watch, it's going to survive and everything.' He basically looked me straight in the eye and said, 'No it won't.' He then decided to give the thing

a massive twist to see if he was right and it practically came off in his hands. It didn't survive him at all and Mark's not a big guy, so that particular incarnation never even got close to the rule."

Eventually the handlebars were in place, and they

helped to give *Paperboy* a thoroughly different experience to all the other arcade games that were around at the time of its release. Once you gripped those handlebars in both hands, you were ready to set off on your delivery route through suburban America. With its brightly coloured houses, traditional mail boxes and copious amounts of speech, you could almost imagine that you were actually riding down a sidewalk and delivering papers. To further add to the realism, Salwitz and Ralston ensured that the majority of obstacles you encountered also added to the authenticity. Therefore, dangerous dogs would chase you up the street, huge cars and motorcycles would zip across each road's junctions, and there were even remote controlled cars and self-aware lawn mowers to avoid. While the hazards would get stranger the further you progressed, they were nothing like the obstacles that Salwitz and Ralston had originally intended to use...

"Initially, we wanted *Paperboy* to have a really surreal feel to it," explains Salwitz. "We went pretty crazy for a while and the focus groups that saw it just didn't get it," remembers Ralston. "We had things like speedboats

Mindscape's sequel was so bad, this is the only mention we're going to give it. The N64 version wasn't much better.

The original arcade flyer. Note the machine shot showing those famous, now iconic, handlebars.

going down the middle of the street, runaway pianos, giant snails at the various junctions and even ducks in business suits that would walk up and down the sidewalk. Just really bizarre stuff like that," he chuckles. "The actual perspective was the same, the look of the art style was the same, and it was just all these wacky characters that weren't received very well.

"For some reason when people rode down the street they just didn't expect to see them," continues Salwitz. "Which is strange," interjects Ralston who, like Salwitz, is once again fighting back laughter. "I see these things all the time."

Gender issues

Ralston may well be used to seeing the grim reaper and unicycle-riding punks whenever he goes for a Sunday drive, but one thing that is noticeably absent from *Paperboy* is the ability to play as a girl. As Salwitz explains, the absence of a female delivery girl was down to memory restrictions and not for any other reason.

"Physically, our ability to put more than one character into that hardware would have been very expensive at the time," he tells us. "The system constraints just stopped you from doing a lot of things and you were literally counting every byte you were putting into things. The central character of the game used an enormous amount of memory, particularly graphics memory (EEPROM) so the storage of that would have been very prohibitive. So we were really stuck with a single character no matter what we did. As for the choice between whether it should have been a paperboy or a papergirl, you just kind of go with the thing that's the most obvious, except of

DEVELOPER HIGHLIGHTS

course for the giant snails and all those other things. I'm sure we talked about it at the time, but there would have been no practical way for us to get more than one character in the original game."

With the thought of what didn't make it into the game still fresh in their minds, we wanted to find out what other aspects of *Paperboy* ended up on the cutting room floor and failed to make it into the game.

"WE WERE STUCK WITH A SINGLE CHARACTER"

JOHN SALWITZ

Due to its arcade success, *Paperboy* appeared on a variety of home formats, so we've gathered a small selection here. (Top row from left to right: C64, Amiga, Atari Lynx. Bottom row from left to right: Master System, Spectrum, Game Boy.)

"Well, I remember just how much trouble we went to in trying to give the Paperboy a throwing animation," muses Ralston. "In the end though it was proving to be such a nightmare we just decided that he shoots them out of his head." Other missing features included proper physics and motion that would see newspapers bounce off walls or get caught in hedges; a larger obstacle course, which at one stage was even going to be the basis for a sequel; and the ability to ride down the other side of the street. "I particularly liked this one," admits Ralston, "and we talked about how we would implement it for ages. We initially talked about going down the other side of the street and having it go in the reverse direction and bringing more traffic into play, but then we would have had the safety commission coming down on us even more."

"OUR ABILITY TO PUT MORE THAN ONE CHARACTER INTO THAT HARDWARE WOULD HAVE BEEN VERY EXPENSIVE AT THE TIME... YOU WERE LITERALLY COUNTING EVERY BYTE" JOHN SALWITZ

With the benefit of 23 years of hindsight we are eager to know what changes Salwitz and Ralston would have made to the game if they'd had the time and opportunity.

"One thing we did think about at the time was to ship *Paperboy* as a serialised game," reveals Salwitz.

"At the time everything in arcades was based on how much replay you would get out of it, so we did once consider shipping out just Easy Street and then releasing the other two roads three to six months later. I think if we'd gone with this serialised release we would

have sold more units."

"Man, that's greed, pure greed," laughs Ralston. "If I was to return to *Paperboy* today the only element I can think of expanding would be the whole BMX biking side of the game and maybe working a trick-based scoring system into it. You could have style points for throwing papers while in a jump, or doing a flip or whatever. I think that would have worked really well..."

While Ralston muses about his super-athletic Paperboy, we wanted to ask Salwitz why he thinks their creation remains so enjoyable to so many gamers. "We had a wonderful team," he concludes, "and the people involved are still my very dear friends. We had a really good time working together, and to be able to work with four or five people and have each of them focused on a completely different part of the game and still be able to talk about it afterwards is a really rare and wonderful experience. I feel *Paperboy* was successful because the team was successful."

25 YEARS ON

Amazingly, Atari's *Paperboy* is still wow-ing gamers, and it's on Microsoft's Xbox 360 of all things.

Converted by Digital Eclipse, the Xbox Live version of *Paperboy* features online leader boards, a variety of achievements (some of which are incredibly hard to earn) and an assortment of online two-player games.

Sadly, while the game is as enjoyable as ever – although if we're brutally honest, the 360's D-pad isn't a match for the arcade machine's handlebars – taking the title online wasn't perhaps the smartest move that Digital Eclipse has ever made, mainly because it's just so damned laggy.

Still, it's certainly not bad for 400 points (around £3.50) and while an updated look would have been nice it certainly beats being a paperboy for real.

THE MAKING OF DUNGEON MASTER

WHEN TINY SAN DIEGO STUDIO FASTER THAN LIGHT (FTL FOR SHORT) RELEASED DUNGEON MASTER ON THE ATARI ST IN 1987, THEY KNEW THEY HAD CREATED SOMETHING SPECIAL. WHAT THEY COULDN'T HAVE PREDICTED WAS THE TREMENDOUS WORLDWIDE SUCCESS THE GAME WOULD ACHIEVE AND THE IMPACT IT WOULD HAVE ON FUTURE...

- **Expect to pay:** £8+ (\$10+)

The guys who made it happen.

Like so many partnerships forged in the early days of the videogame industry, the team responsible for *Dungeon Master* came together at school. "Andy Jaros and I met during college, attending the University of California," recalls Doug Bell, who worked as director, lead designer and developer on *Dungeon Master*. "Andy had received an Apple II from his parents and we played *Ultima* on it and later *Wizardry*."

It was during these mammoth gaming sessions that Bell finally realised his true calling: "I thought I could write a better game than *Ultima*," he modestly comments. With this goal in mind the two friends founded their own development studio called 'PVC Dragon' (PVC as in the material used to create floppy disc storage wallets). Raising capital by selling shares in the fledgling company to close friends and family the intrepid duo started working on their all-conquering fantasy title, which they named *Crystal Dragon*. However, after two years of hard slog the company coffers were running dry and a difficult decision had to be made. "We decided to see if another game company was interested in picking up our game," continues Bell. "We had recently moved to San Diego and contacted the local game companies, one of which was FTL, owned by Wayne Holder." FTL, responsible for Apple II classic *SunDog: Frozen Legacy*, took the pair on board in 1983, albeit on a temporary basis. "Wayne decided to take us on for a few

months to get the game to a working state," Bell fondly remembers about the time.

The Atari ST arrives...

A couple of months after joining FTL, Atari sent shock waves around the globe with the announcement of the ST home computer, and at FTL development on the Apple II version of *Crystal Dragon* was brought to an abrupt halt. "The Atari was a much more capable computer than the Apple, and better suited to *Crystal Dragon*, where we were spending a great deal of our time trying to fit it in the Apple's 64K" comments Bell. Unfortunately there

wasn't time to port the work they had already done and complete the game for the debut of the new 16-bit machine. "We decided it was important to have a game at the launch of the ST, which was scheduled for late 1984" says Bell. "Wayne, Andy and I decided that porting

"THERE WERE BASICALLY ONLY FIVE OF US. DENNIS WALKER AND I DID 90 PER CENT OF THE GAME PROGRAMMING"

DOUG BELL

SunDog was a better project than trying to develop a new game for the new platform". The team updated the sci-fi adventure for the 16-bit generation and the Atari ST version was released on Christmas Eve, 1984. A stunning game on the Apple II, it was even better on Atari's 16-bit system, thanks to stunning visuals that got gamers very excited.

"THE SCOPE OF THE GAME WAS INITIALLY GOING TO BE LESS THAN WE ENDED UP DOING"

DOUG BELL

You'll never forget the first time you have to face off against mummies. They became one of *Dungeon Master*'s most iconic monsters.

Dungeon Master 2 featured improved visuals and sound.

With one triumph and the very valuable experience of coding on the cutting edge ST under their collective belts, Bell and Jaros became full time members of the FTL team and quickly turned their attention back to *Crystal Dragon* – which had now been re-named *Dungeon Master*. The creative process called upon additional commitment in terms of programming – and the results were encouraging. "We started with a proof of concept to use a painter's algorithm (drawing from back to front) to create the dungeon," says Bell when we quizzed him about the game's early origins. "We wanted to see what the performance was, and it was okay, but we realized that we needed to switch from Pascal to C. I spend three weeks learning C and rewriting the dungeon crawl in C, and the performance was better than we expected".

Small beginnings

Compared to the sprawling development studios of today, the core team behind *Dungeon Master* was minuscule. "There were basically only five of us," recalls Bell. "Wayne did only a little of the programming – his biggest contribution was to figure out how to do digitized sound on the Atari's sound chip. Andy Jaros did all of the artwork. Mike Newton created the tools, including the DCS (*Dungeon Construction Set*). Dennis Walker and I did 90 per cent of the game programming." Each team member had their own responsibilities, but additional brainstorming was welcome, as Bell confirms: "We all contributed the ideas that set *Dungeon Master* apart from other games. I think some of the biggest conceptual contributions were probably made by Wayne, particularly with regards to the user interface".

The team soon became aware that they could expand the concept beyond the original *Crystal Dragon* brief. "The scope of the game was initially going to be less than what we ended up doing," comments Bell. "We had planned on releasing a game at the end of 1985, and in preparation for that, released a demo in May of 1985. Around September we realized that we had the potential to create a landmark game, so we decided to expand the scope of the game and forgo the 1985 release". The extra time meant Bell and his team could achieve almost everything they had set out to do – a fairly unique event in videogame production: "There were some ideas we had to shelve, but for the most part we simply took the time to make the game as good as we could without being dictated too much by the schedule," he continues.

Dungeon Master would prove itself to be a tremendously immersive experience and boasted a degree of realism that was seldom seen in role-playing titles before or since. Characters required food, water and sleep in order to survive, torches were essential to light the dim passageways (and would burn themselves out after a period of time) and some enemies could be eaten once

Dungeon Master Nexus took the series into true 3D.

The SNES port contained the Super FX chip – although it's hard to tell how it was used.

Scrolls reveal handy hints and various spells.

Tree-like Screamers emit a high-pitched sound to inflict damage on you.

slain. However, as impressive as these elements seemed at the time, most had been on the drawing board since the early days of *Crystal Dragon's* development and Bell feels that *Dungeon Master's* merits actually lie elsewhere: "I think the user interface, graphics, sound and gameplay were what set us apart, and to a much lesser extent, the refinements of what previous dungeon games had done". Indeed, FTL's game was one of the first adventure titles to ditch the keyboard in favour of a fully mouse-driven interface. Another massive breakthrough was the fact that the game took place in 'real time' – role playing games up to this point were almost always turn-based affairs – just like the tabletop games from which they took their inspiration.

"I THINK IT'S SAFE TO SAY THAT NO GAME EVER GOT AS MUCH ONTO A 360K FLOPPY DISK"

DOUG BELL

Although the enemies were gifted with only a handful of animation frames, *Dungeon Master* was a masterpiece of spooky set pieces and literally dripped with oppressive atmosphere. "We wanted to create an immersive experience," states Bell about *Dungeon Master's* atmosphere. "That was the guiding principle behind having the action take place in the dungeon as much as possible. The scary aspect really just evolved from the fact that up to that point there had not been a real-time 3D dungeon game with the level of graphics and sound in *Dungeon Master*. Once you were sucked into the game it didn't take much to scare you".

This level of immersion was so cherished by Bell and his team that they didn't want anything to shatter it. "We were targeting the Atari 520 ST on an SS 360K floppy disk. We didn't want to have to interrupt the gameplay with disk swaps. A lot of the technology in *Dungeon Master* was spent on compression/decompression algorithms. When fully expanded, the game that fitted onto a single floppy disk was about 1.6M. There was a sophisticated memory manager that kept the graphics compressed in memory so that we could fit more." Bell is justifiably proud of his team's achievement in this regard: "I think it's safe to say that no game ever got as much onto a 360K floppy disk or into the Atari 520ST's memory as *Dungeon Master*".

Released in 1987, *Dungeon Master* won a raft of accolades and topped 'game of the year' charts in practically every videogame magazine of the time. It went on to become one of the bestselling 16-bit home computer games of all time and achieved an incredible 50% market penetration on the Atari ST alone. The success of the game was not lost on rival developers, and companies such as Westwood Studios (*Eye Of The Beholder*, *Lands of Lore*), Sega (*Shining* and *The Darkness*) and Mirrorsoft

OTHER VERSIONS

Theron's Quest
This PC Engine conversion is probably one of the most notable ports as it deviated from the original *Dungeon Master* in a number of ways. Subtitled *Theron's Quest*, it is split into seven small dungeons, each of which contained puzzles and maps from the original home computer versions of *Dungeon Master* and *Chaos Strikes Back*. The most sweeping change is the introduction of an anime intro and storyline – the player assumes the character of a teenage boy proving his worth by defeating an evil force (a plot that should come as no surprise to any hardened JRPG fan). The final product is a very toned-down version of FTL's classic game, but is still worth seeking out.

Dungeon Master Nexus
Released in 1998 by Victor Interactive, *Dungeon Master Nexus* is a Japanese exclusive for the Sega Saturn. Developed entirely in Japan (where *Dungeon Master* has a massive following), the game is an admirable attempt to update the classic formula in 3D, but is hampered by the primitive graphic engine and slow, unresponsive controls. Most of the in-game text is in English and while it's not an especially expensive game, the limited print run means it is extremely hard to find these days.

A Screamer from *Dungeon Master Nexus*.

That pile of bones is one of your fallen champions.

Doors can be opened in a variety of ways.

The entrance to the dungeon – anyone with sense would turn back now...

(*Bloodwyche*) tried to emulate the winning formula of FTL's title, with varying degrees of success. *Dungeon Master* was converted to different formats including the Amiga, Sharp X68000, PC, FM Towns, PC-9801 and Super Nintendo. An enhanced version with additional animation and sound was produced for Commodore's ill-fated CDTV, but development stalled (and was eventually cancelled) due to Commodore's failure to provide FTL with reliable information regarding save-game options on the machine.

Expanding out

Given the massive success of *Dungeon Master* it was inevitable that FTL would expand on the game in some way. "*Dungeon Master* was developed with the idea of creating many scenarios," continues Bell. The first of these expansions was *Chaos Strikes Back* – however, it bucked the trend of the time by being published as a stand-alone game that did not require the original to run. Although it used the same game engine and many of the same enemy sprites, it proved to be an excellent title and things looked positive for future instalments along the same lines. Sadly, other commitments got in the way, much to Bell's chagrin. "One of my regrets is that we got so busy doing ports of the game that we didn't end up creating enough scenarios," he comments.

Chaos Strikes Back was a hit when it was first published in 1989 and satisfied the hardcore *Dungeon Master* fans, but what everyone really craved was a full-blown sequel. The wait was to be an excruciatingly protracted one. *Dungeon Master II: The Legend Of Skullkeep* had an extremely lengthy development period and by the time it was eventually released in 1995 the goalposts had not so much been moved, but rather uprooted completely. The game retained the familiar 2D visual style of the original *Dungeon Master*, with the addition of outdoor locations and a more complex game engine. It was an excellent game, but lacked the visual polish to tempt people away from newer adventures.

Although the sequel did sell extremely well and garnered some positive review scores, it was something

"DUNGEON MASTER WAS DEVELOPED WITH THE IDEA OF CREATING MANY SCENARIOS"

DOUG BELL

of a letdown after the groundbreaking original. It would also prove to be FTL's final roll of the dice and the company ceased operations in 1996. Bell remained with them right up to the bitter end. He has since left the games industry in favour of a career that is more suited to his current lifestyle. "I'm currently a software architect for a company that develops software for the auto insurance claims industry," he explains. "It's quite boring compared to the game industry, but it also consumes far less of my time. I have two sons, nine and 12, and I spend a great deal of time with them... something I'm not sure was possible in the games industry".

THE MAKING OF ROAD BLASTERS

AN ATARI GAME THAT MADE MAD MAX LOOK LIKE A SUNDAY MORNING DRIVE, ROADBLASTERS SKILFULLY MERGED RACING AND SHOOTING ACTION. EX-ATARI DEVELOPMENT TEAM MARK STEPHEN PIERCE, BONNIE SMITHSON AND ROBERT WEATHERBY LINE UP ON THE STARTING GRID

Robert Weatherby has worked on many more coin-ops for Atari, including 1995's *Area 51*, which was a fun shooter.

Atari's Lynx conversion retained much of the coin-op's speed and is much more forgiving than the original.

The Spectrum 128k conversion of *RoadBlasters* is one of the better efforts and is certainly worth playing.

IN THE KNOW

ROAD BLASTERS

- **Publisher:** Atari Games
- **Developer:** In-House
- **Platform:** Arcade
- **Year released:** 1987
- **Genre:** Racing/Shoot-'em-up
- **Expect to pay:** £400+ (\$900+)

"The game was originally called FutureVette, like a Corvette... but from the future," says Mark Pierce, who pauses before adding:

"I thought it was a hideous name." Mark is one of three key team members we tracked down who worked on Atari's classic 1987 game, which deftly merged shooting and racing action, and which was eventually renamed *RoadBlasters*. He's trying to remember the game's origins, which escape programmers Bonnie Smithson – the first of the team on the project – and Robert Weatherby. Mark recalls that the game was Lyle Rains' 'baby', and the design document was, thankfully, better than the game's name: "It was one sheet of paper. 'FutureVette' was at the top, and there was a paragraph of text that pretty much said: 'You can drive real fast and shoot!' The vision was a mash-up of *Pole Position* and *Spy Hunter*, which was popular then."

Training wheels

As noted, Bonnie was first on the project. A recent Atari hire and new to gaming, she recalls being given tasks to get the hang of how game software was structured. "For this one, I was asked to program a graphics board to change the line offsets on hblank to shape a roadway," she says. Armed with a *Pole Position* cabinet for reference and Atari's System 1 hardware, Bonnie got a basic racing road up and running fairly quickly. "Pole Position had hardware to make the road move, but my experiment showed that it was possible to create the same effect with less custom hardware."

Mark recalls that this was essentially the game that existed when he joined the project: "Bonnie was rebuilding Pole Position's technology, and she'd created a road and the horizon that moved left and right. I think there was also a car sitting pinned that would turn a bit – all very rudimentary."

But with Mark and Bonnie working together, along with occasional input from other Atari staff, things rapidly evolved. "After we had the first-person view of the car, we added traffic, collisions, shooting, adversaries, points and scoring, and started working up levels," says Bonnie. "There were continual rounds of refinement, and so a typical day would include me composing new functionality and incorporating gameplay feedback and graphical refinements, and I'd add nuances to simple implementations that were placeholders."

Production of the game was an iterative process, and Bonnie was keen to make things 'tuneable' in real-time. "I exposed nearly every value in the game to something I could tweak while others were playing, and so if they complained about something I could immediately change it to see if they thought the game improved. I love real-time programming, and so I liked the timing constraints of the hardware. It was a challenge to slice up the processing so it could be done in time to make the game feel good. I learned what trade-off a gameplay designer wanted access to very quickly and gave it to them."

After several months, the team had a solid game where you raced against a timer, frantically blasting everything in your path as you did so. During testing, Lyle Rains deemed that feedback wasn't strong enough and so Robert Weatherby, fresh from *Championship Sprint*, was asked to join the project, to inject fresh ideas and assist with programming.

On playing the game, Robert found it too easy to blow up other road users: "You could lay on the trigger and everything would get destroyed – there weren't any real hazards – so we armoured some cars, which meant you had traffic to contend with."

Having designed *Super Sprint*'s car attribute power-ups, Robert decided that he wanted to have something similar for *RoadBlasters*, and so extra weapons were added to the mix in order to make the new game more fun. "One of these came from a development mode I'd created, where collisions were disabled, enabling us to drive through other

cars," says Bonnie. "As Mark and I were playing, we decided to make this a weapon option, which became the electro shield."

"And I think I was the one to suggest replacing *Spy Hunter*'s van with a plane that swoops in with your weapon," adds Mark. "It looks terrible today, but back in the day it was 'Wow!'"

Time waits for no one

The biggest change that Robert instigated, though, was ditching a timer – something he'd also done in *Super Sprint*. But the team wasn't convinced. "I didn't want to race against a clock – I wanted something more dynamic that acted like a clock, so I threw out there the idea of adding fuel strategically, and you acquiring it in order to finish a stage," remembers Robert. "People were lukewarm to the idea, but I was stubborn, said to give me a couple of weeks to show everyone what I was talking about, and went ahead and programmed it anyway."

Robert's fuel feature changed the game, adding depth: "As you race, you know you don't have enough fuel to complete each course, and so the game becomes a challenge that forces you to navigate between traffic to acquire fuel globes." When I first programmed that, you'd shoot a car and the fuel globe would fly by so quickly that you'd have no way to grab it," recalls Robert. "So I had the idea of having the globe 'hover', continuing along the track, but decelerating, giving you the opportunity to catch it. I thought this really made the game fun – you're racing at high speed, shoot a car ahead of you, and have to squeeze between cars to grab the fuel you need to survive."

Adding the extras

Some would have seen Robert's abrupt input as an intrusion, but Mark welcomed it: "Robert's a real good guy. A lot of people call themselves games designers, but I don't buy into that – they edit levels. But Robert understands how a game's got to have a hook, how to tune something, how to make an experience successful for a broad base. He, Dave [Wiebenson], Bonnie and I worked together to improve the game's design and we were a great team."

More features were slowly added to the game. "I contributed the idea of dune buggies that sped ahead of you and slammed on the brakes, Robert added 'fish tailing' and other aspects of car handling, and Brad Fuller added fantastic sound work that added immeasurably to the game," says Bonnie. "I also worked hard on adversary intelligence – programming I'm still proud of. Others on the team described what they wanted and it was my job to translate subjective terms of game 'feel' into code."

Mark's keen to point out Dave Wiebenson's contribution during this period of development. Beforehand, Dave had largely been a technician – the guy who'd build prototypes, go on field tests, and ensure that cabinets would work properly. But with *RoadBlasters*, he became heavily involved in laying

"WE BECAME AWARE OF OUTRUN DURING DEVELOPMENT AND WERE SALIVATING ABOUT ITS HARDWARE"

MARK S PIERCE

out tracks. "Much of the success of the game was down to how Dave edited the levels," claims Mark. "He'd sit and edit text files that were pages and pages long, and he'd compare the code with the on-screen experience. Everyone at Atari was playing games in the lab, so Lyle would be there and I'd be playing all the time. We'd all be providing feedback – 'This turn's too easy, that one's too hard, this one works really well' – and Dave would be comparing the code to what was happening in the game."

Particularly instrumental in ensuring *RoadBlasters*' longevity, according to Mark, was the placement of fuel globes: "When the fuel globes came in, that kind of tied everything together, and Dave would watch how people played and then reposition the globes accordingly." Over time, testers would find they'd run out of fuel with a globe hovering tantalisingly just out of reach. "They'd then 'coin up' again, because they'd think, 'If I'd only done this one thing differently, I'd have made it,'" says Mark. "Dave's work on this area of the game was simply genius. To my knowledge, *RoadBlasters* was the only game that he worked on the software for. I think Atari gave him a design credit, and up until that point artists were artists and technicians were technicians, and so the fact that bridge was crossed was also kind of unique."

RoadBlasters also stood out due to its exciting visuals, which were mostly designed by Mark. He utilised Atari's then-cutting-edge 3D system to kick-start object design, rather than hand-drawing everything. "The system was the one used for *I, Robot*, modified so I could model a car," he explains. "The process was tedious back then, but we built a program that would take my model, rotate it, take a snapshot and make a bitmap." The end result was noisy, messy and lacked textures, but Mark notes that when the images were retouched the end results were better than other games of the time.

However, the *RoadBlasters* project faced huge technological limitations, which enabled a rival to blaze past. Limited EPROM space meant horizon

RoadBlasters enables you to level-skip, rather than forcing you to play through the entire game.

COMPETITION TIME

It's noted that the low price point for *RoadBlasters* made it a compelling purchase for operators at the time, but Mark Pierce reveals that a simple competition made them positively giddy with excitement for the game.

"We decided to implement a T-shirt contest," says Mark. "If you got to the game's last level, you got one chance at it. If you completed it, you got a huge bonus score and a screen came up that let you win a T-shirt – it gave you a secret code. If you sent the code in, we'd send you a *RoadBlasters* T-shirt."

Mark remembers that the promotion was hugely successful: "I can't tell you how many operators over the years have thanked me for putting that feature in *RoadBlasters*, due to the sheer number of people who'd come back to the game and play it just to try and win the T-shirt. I remember that we kept on giving out T-shirts long after the cut-off date we'd originally set!"

to blaze past. Limited EPROM space meant horizon backgrounds had to work as stamps, forcing flipping and colour variations. "You couldn't just draw the pictures – you had to draw them and work out how to make them efficient," says Mark. But there was a bigger issue: Atari had no way to scale objects in 3D. "This meant we had to simulate scaling by drawing several versions of each graphic, and they'd 'pop' as they came towards you," says Robert, adding that the hardware also caused *RoadBlasters* to be a completely flat game, lacking hills and dips. This might have been fine if it wasn't for Sega's *OutRun*. "We became aware of that game halfway through *RoadBlasters*' development and we were salivating about Sega's hardware," laughs Mark. "If we'd had something similar, *RoadBlasters* would have had way more graphics, but we had to burn up so much ROM space with several versions of each car, bike, gun turret and roadside object." This also explains *RoadBlasters*' barren landscape, compared to Sega's classic racer – although one might easily argue that the Atari game's dystopian leanings suited such an artistic direction – as there simply wasn't room for more objects. "We were also limited from a performance standpoint, which is why there are always only a limited number of objects on the screen," says Mark. "We wanted to do tunnels and bigger explosions that scaled as they came towards

you, but there was just no way. Sega could do that stuff because they just used one image for each object and scaled it."

But it wasn't all bad news for *RoadBlasters*. "I've worked on lots of games, and *RoadBlasters* remains endearing to people," says Mark. He thinks this is down to the game's simplicity, tight level design, and the uniqueness of the mash-up. "It got to be that, during development, we'd play other racing games without shooting and it would feel like something was missing," he says. And although *RoadBlasters*' hardware paled beside Sega's, Mark notes it was far cheaper: "It had an attractive price point for operators, and so the game was very successful – a surprise hit that came at a time when Atari needed it. Every now and again, you're fortunate enough to work on something that strikes a chord with pop culture, is accessible to play, and that does well for everyone – *RoadBlasters* was one of those games."

"I WORKED ON LOTS OF GAMES, AND ROAD-BLASTERS REMAINS ENDEARING"

MARK S PIERCE

THE MAKING OF CHIP'S CHALLENGE

IT WAS A TALE OF LOVE, A PURSUIT DRIVEN BY DESIRE. AND THAT WAS JUST THE STORY OF CHUCK SOMMERVILLE THE CREATOR OF CHIP'S CHALLENGE. DAVID CROOKES TAKES A LOOK AT HOW CHUCK CREATED ONE OF THE BEST PUZZLE GAMES EVER MADE

IN THE KNOW

- **Publisher:** Atari
- **Developer:** Epyx
- **Platform:** Atari Lynx
- **Year released:** 1989
- **Genre:** Puzzle
- **Expect to pay:** £5+ (\$5+)

Chip McCallahan was a nerd. More to the point, he was a nerd who was in love. And, like any nerd, he had to prove his worth; otherwise he wouldn't be allowed access to the exclusive Bit Buster Club. A refusal would spell disaster – for then there would be no chance of him ever impressing Melinda The Mental Marvel, the hot girl he met in the school science lab. And that, dear readers, is Chip's ever-so-slightly-difficult challenge.

It's a game full of problems, that's for sure. How else could you describe working your way around Melinda's clubhouse in order to impress? It may sound easy enough on paper, but when it is strewn with deadly monsters, cosmic chip sockets and – just as bad under the circumstances – many locked doors, then you do have to question just what Chip saw in the girl and whether it was all worth it.

Secret squirrels

And then you look at what went on behind the scenes as the game was meticulously put together. Substitute Melinda for Chuck Sommerville, the creator of the game, and Chip for the army of programmers who wanted in

on Epyx's elite club and it becomes clear the game was a stark case of life imitating art.

"It was a little cloak and dagger in the building where I made Chip's Challenge," explains Chuck. "I was making the game for the Lynx and I was in a closed area at Epyx with key-card access. I remember there being some resentment from the games programmers who weren't working on Lynx games. They felt excluded and shut out."

Epyx was very protective of its Handy project and it didn't want any details about the handheld to be leaked to the outside world. So it ensured that only a few people would know about the machine and its games and so the very best programmers were chosen; then ordered to keep quiet. It meant Chuck beavered away for ten weeks on Chip's Challenge in a kind of secret society; one that actually had an inner and outer core. Although Chuck stayed in the outer core, it didn't bother him. "I was just glad to be working on the Lynx because it had a fast rendering engine," he said. "It was a lot of fun and it allowed things to be done that we could never do on the Commodore 64."

The inner level of security surrounded the encryption team, which would take the final binary and add the

• You can unlock further levels by finding the passwords. Handy, as there's no save system.

• When you make it through a level, the game gives you some lovely triumphant stats. Go Bit Buster!

Some of the levels revolved around action, others were firmly puzzle-oriented. Some had time limits to urge the player on and add variety. The idea was that you used the Lynx's D-pad to move Chip around the cleverly designed levels. Once enough chips were collected, it was then possible to open the chip socket, leave the stage and proceed to the next level. The player's score was also an important factor. It was not just a matter of completing the game or a level but trying to amass as many points as possible – certainly more than a friend could manage.

Initially, however, Chuck could not gain company approval for the game's development so he began by knocking together a simple map and logic code in low-res on the Apple II. Colours defined the tile types. Once he had the game up and running, he was able to show it to

Chip in a confusing-looking situation.

MORE CHIPS?

Although Chuck Sommerville has many screenshots for *Chip's Challenge* 2, he refused to actually share them with us. To do so, he explains, would only stoke the fires and encourage people to call for its release once again.

"I try to downplay CC2," he says. "It puts me in a difficult position because I have just put it behind me." I spent about two years working on CC2 with the agreement that the company that held the rights to the first game would work with me to get it published," he adds. "After I finished, they were not very helpful. But they also would not let me release it on my own. I spent a couple years really upset about it. For several years after that, about once a year, someone would approach me with some hopeful way to get the game to market, but each one eventually faded out. I finally decided to not be concerned about it any more, and just put it behind me."

Interestingly, Chuck recently released on iOS game called *Chuck's Challenge*.

"I HAD EACH LEVEL TESTED TO MAKE SURE THAT IT WAS POSSIBLE TO COMPLETE AND I ALSO HAD EACH RATED FOR FUN AND DIFFICULTY"

CHUCK ON THE TESTING PROCESS

his bosses at Epyx who decided it would be a fun title. It would also add to the roster of games that Epyx was keen to make available for its handheld. "The most important part was getting the go-ahead from Epyx," he says. "It was hectic, but I think it went smoothly." Chuck's team got to work. They used a paint program on the Amiga to design the maps. By putting the art tool into grid mode, and putting little bar codes in the corners of the tiles, the saved artwork became the map file.

The personal touch

"We had a software tool that could read the codes from the art to build the maps," says Chuck. "I also hired Bill Darrah, who I knew to be a prolific puzzle designer, to design levels." Bill was one of Chuck's close friends and he was able to convey to him the results he required from his game. This partnership was so successful that, between them, they knocked out two-thirds of the levels.

"I continued to add new gaming elements as we went along," explains Chuck about the ever-changing design.

"In the end, I designed about a third of the levels, Bill designed about a third and the rest were designed by other engineers and testers."

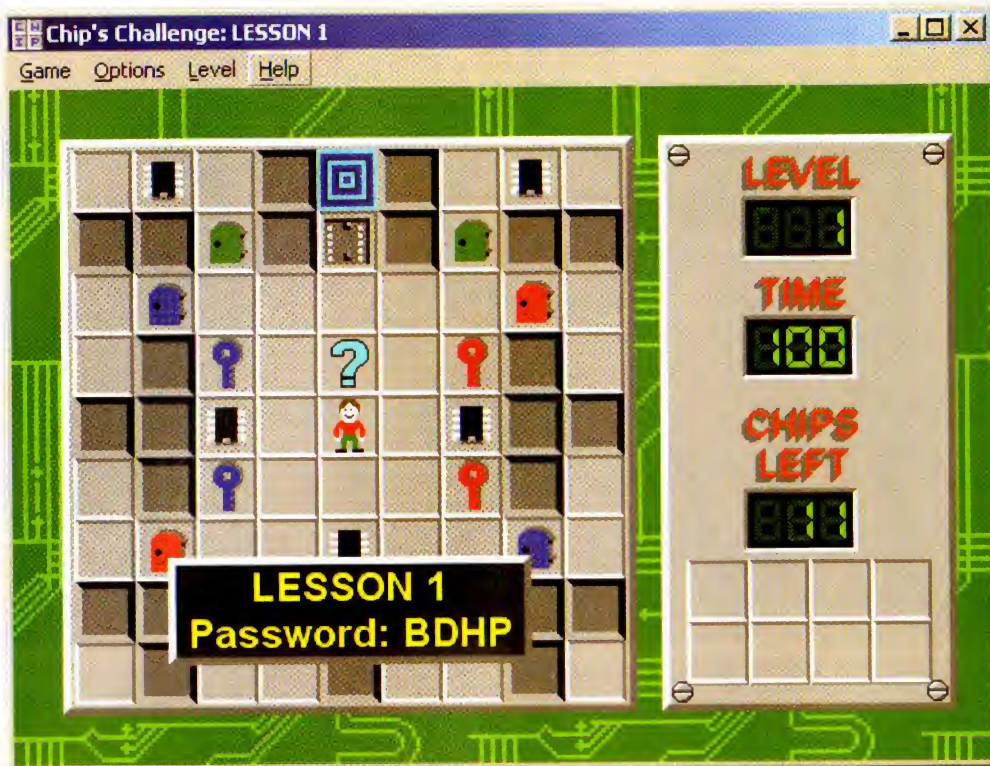

Although the original intention had been to make a different type of game entirely, Chuck was nevertheless pleased to be able to work on a puzzle game and *Chip's Challenge* remains the game that he loves the most.

"I wrote *Chip's Challenge* for myself," he proudly tells us about the obvious labour of love. "It was the game I always wanted to play. I had spent several years writing games designed by others, games that were chasing themes the marketing department thought they could sell. I wanted to make a game that was all about gameplay and this was it."

Chuck says he has always liked maze games. "Even back in high school, I had this idea for a maze that could change when you stepped on certain buttons, making the maze much more complicated than it looked," he laughs. "But it was Boulder Dash and Emerald Mine that really showed me that a game like this could work."

The very cheesy looking advert for *Chip's Challenge*. Are you man enough to help Chip get into Melinda's exclusive club?

The game made it on to the PC too – but Chuck Sommerville wasn't 100 per cent happy with the final version.

Some of those influences are obvious if you're prepared to look at *Chip's Challenge's* gameplay. The block-pushing element is similar to Sokoban, for instance, and is used to clear paths and allow Chip to navigate around the playing area. To encourage the pick-up-and-play nature of the game, the first eight lessons were deliberately made easy and were, in essence, for tutorial purposes.

Yet even though it was a game Chuck had always wanted to create, he didn't have the whole concept planned out in his head from start to finish. He created it from his heart, discussed gaming elements with friends and took on board new perspectives. "I took each idea, and tweaked it to fit in with the rest," he recalls about the game's process.

An isometric viewpoint was discarded almost immediately – "I also decided to get rid of any gravity component and stick with a straight top view" – and the team had no problems getting the game finished.

"It was well timed," Chuck remembers. "About this period, the testing department was mostly done with the other Lynx games, so I had access to a small army of testers. I had each level tested to make sure that it was possible to complete and I also had each rated for fun and difficulty. The final stage was left to me. Based on the ratings, and my own judgement, I had to pick which levels and what order to put them in."

The game proved to be a great success – "Let's be clear though, it was never intended to be a Tetris beater" – and quickly became one of the Lynx's killer apps, something Atari's plucky little console desperately needed. But it wasn't long before the title was ported to

other machines. In fact, it was translated to virtually every machine available at that time, including the Commodore 64 and the PC.

The PC version of *Chip's Challenge* was converted by a games team at Microsoft, headed by Chuck's friend Tony Garcia. But Chuck wasn't. "It's not a game I care too much for. Instead of sliding across in quarter-square increments, the monsters jump from square to square and that makes it harder to work out which direction they are going," he explains. The PC version also happened to have a save feature while the Lynx used passwords (entering MAND

would give the player access to a handy Mandelbrot set and a Julia set fractal plotter).

But the fun doesn't stop there. Although *Chip's Challenge 2* is, sadly,

not likely to ever see the light of day, the game still retains its many fans. Some of these have been developing their own levels and even Chuck gets involved by dishing out encouragement. One of the fruits of their labour is the *Chip's Challenge Level Pack 2* that has another set of 149 levels to play and there is also a tool called Chip Edit, which allows for users to create their own levels.

Interestingly, Chuck himself coded a new iOS game called *Chuck's Challenge*, which is as close to a *Chip's Challenge* sequel as we're ever likely to get.

"I'm pleased the game is still being played and that people still enjoy it," says Chuck. "It's amazing, given that it only took ten weeks to make. It was unheard of even back then to knock out a game in such a small amount of time. But we did that and created what some people say is a classic, which is wonderful."

THE MAKING OF ALIEN VS PREDATOR

IT WAS THE 'OTHER' REASON TO OWN AN ATARI JAGUAR, AND STILL FEATURES REGULARLY IN TOP-TEN LISTINGS OF THE SCARIEST VIDEOGAMES OF ALL TIME. REBELLION FOUNDERS JASON AND CHRIS KINGSLEY, AND ATARI PRODUCER JAMES 'PURPLE' HAMPTON TALK TO MIKE BEVAN ABOUT DESIGNING A CULT CONSOLE CREATURE FEATURE

The Alien movies have been one of the most influential of all film franchises for the videogame industry. A key inspiration for the 'bio-organic' style of a huge number of 2D titles in the Eighties and Nineties, notably the 'Gigeresque' visuals of R-Type and Turrican, the distinctive, dark futurism of Ridley Scott's original Alien inspired countless budding pixel-artists. The saga has spawned dozens of licensed arcade and domestic videogame titles, from platform shooters to scrolling beat-'em-ups and lightgun games, and a range of successful first-person corridor shooters on various different systems. The Jaguar outing of *Alien Vs Predator* represents perhaps the biggest leap the licence ever made in the gaming world, throwing in Fox's second most famous creature, the Predator, and presenting, for the first time, a highly realistic, first-person rendition of close-combat inter-species warfare.

The interactive clash of franchises promised a whole new level of immersion for movie fans – facehuggers bursting onto the screen, Predators decloaking right before your eyes, and the whiplash tail of xenomorphic terrors, all experienced from a perspective planted firmly amid the chaos. Developed across three separate continents, with design and programming teams from Oxford-based developer Rebellion, and support from Atari in Sunnyvale, California, the game was an intriguing, and sometimes strained, exercise in Anglo-American relations. At its best, *Alien Vs Predator* successfully e-creates aspects of the strongest two *Alien* movies, combining the fear and tension of the original film with the all-out gunplay

of *Aliens*. But at the time of its inception, the Atari Jaguar was only at prototype stage, and it wasn't even a certainty that the game would be a first-person shooter, or even appear on the system at all.

A brand new console

Rebellion's Jason Kingsley remembers the moment he first learnt of the existence of Atari's 'top secret' console, evidently a surprise to even Atari's own UK-based personnel at that time. "We went to see Alistair Bodin of Atari in their huge office building and warehouse in Slough (complete with brown Hessian wallpaper and not many people in the office), to present a 3D dragon flight simulation for their new Falcon computer," he reveals. "He thought it looked great and asked Bob Gleadow, Atari's UK managing director, to come down to see it right away. When Bob saw it, he said that it could be a great title for their new console. Alistair was surprised and asked, 'What new console?'"

Bob replied, 'The Jaguar'. It was the first anyone outside of a very small group in North America had heard of the new machine."

James Hampton, Atari's producer for *Alien Vs Predator*, reveals that the

project originally started out on Atari's handheld console – the Lynx. "When I first started working at Atari, in the autumn of 1992, one of my first assignments was taking over as producer on a number of Lynx games. One of these was *Alien Vs Predator*, being developed by UK-based company Images. The Lynx *Alien Vs Predator* team had been assembling a demo that featured a Colonial Marine and a Predator going

- **Expect to pay:** £25+ (\$40)

"WHEN BOB SAW IT, HE SAID THAT IT COULD BE A GREAT TITLE FOR THEIR NEW CONSOLE"

JASON KINGSLEY

● An early Amiga-based version of LightWave was used to create the 3D-rendered image that became the game's box art.

This team photo was taken in front of Atari's offices in Sunnyvale during the summer of 1994 and features many of the *Alien Vs Predator* team. (From left to right) Nathan Brenholdt, Dan McNamee, Lance Lewis (with cap), Mike Beaton, Hank Cappa, Keoni Los Banos, James 'Purple' Hampton, Andrew Whittaker, Andrew Keim, Sean Patten (sitting on sign with sunglasses), Paul Foster, James Grunke.

through corridors of an Alien-infested space station. The Lynx games got put on the back burner, however, as Atari was shifting its production efforts over to the Jaguar launch."

The Lynx game was never completed (although a prototype of it does exist), and Atari's management briefly considered a version of Activision's Super Nintendo *Alien Vs Predator* game, a *Final Fight*-style 2D beat-'em-up, as an alternative project for the Jaguar. "I didn't think this direction represented the characters and the universe very well and I was eager to find a way to improve the design," recalls James. "As I dug deeper into the project, I discovered numerous references to elements from the Dark Horse comic books, elements that Atari did not have rights for. I used this as a reason to change creative direction, and presented an alternative approach to the internal Atari legal and executive departments, and then to our sub-licensor Activision and our partners at 20th Century Fox."

In the UK, designer and programmer Andrew Whittaker, who had collaborated with *Alien* designer HR Giger on the PC horror-adventure *Darkseed*, was approached by Atari to work alongside Rebellion. Giger had personally recommended him for the new game. Andrew would spend long hours discussing the

behaviour and many character nuances of the Aliens with their creator, and the Predator's motivation and design with Stan Winston's movie effects department as well as Fox.

The decision to allow players to experience the game through the eyes of three different characters was one of the first concepts that the Rebellion team hit upon. "Yes, that was Chris and my idea completely," says Jason. "As well as playing the Marine, we also wanted to play the bad guys (Aliens) and the neutral guy (Predator). What it meant though was making three games in one, so it was a very ambitious and challenging game to create."

The texture kings

Another significant breakthrough was the use of digitised textures – modelled from visual references from the films – for the game's environments. "We had already succeeded in getting some texture mapping in *Eye Of The Storm* for the PC, and were excited about the visuals we could get using this technique," explains Chris Kingsley, Rebellion's technical director. "One particularly tough problem we faced was how to create realistic looking texture maps – up to that point all the graphics in games had been hand drawn."

MAIN PLAYERS

COLONIAL MARINE

Mission: Initiate the base self-destruct and escape. The Marine (christened 'Lance Lewis' after one of Atari's level designers) is the weakest and slowest of the three 'species' so must rely on his resourcefulness to survive. With no weapons or security clearance at the start of the game, players must search for arms, tap into the base computer network and security system to access higher levels, and use air ducts and elevators to reach the safety of the escape pod.

ALIEN WARRIOR

Mission: Rescue the Queen from the Predator's huge ship. With endless fangs and a carbonite exoskeleton, Aliens can tear through the base dispatching weaker species with ease. The main advantage of playing as the Alien is the ability to 'cocoon' unfortunate Colonial Marines, using a swift claw and tail-swipe combo, which can then be hatched to provide extra 'lives'. And remember, individual xenomorphs are expendable, it's all about the survival of the Alien breed.

PREDATOR

Mission: Claim the skull of the Alien Queen. The Predator has an unusual 'honour' system, which can be used to gain more increasingly destructive hardware, including the infamous 'smart disks' and shoulder cannon weapons. Although the Predator has the ability to 'cloak', killing with honour means doing so while visible, or risk losing 'honour points', along with your weaponry. Because of his bulk, the Predator is the only character unable to use the air ducts.

"WE WERE EXCITED ABOUT THE VISUALS WE COULD GET"

CHRIS KINGSLEY

A prototype version of the game, featuring an early HUD layout, blockier character models and 'lives' rather than a health bar.

James Hampton (producer, Atari) in front of an Alien Queen during a visit to London's much-missed 'Alien War' attraction, February 1994.

This movie-poster-inspired title screen was later replaced by the rendered art used in the game's packaging.

The games

The original 1990 Dark Horse comic series that kick-started a titanic movie-crossover franchise.

LOVING THE ALIEN

Retro Gamer asked Jason Kingsley of Rebellion, and Atari producer James Hampton how their respective teams had prepared for the unenviable task of re-creating the worlds of the Alien and Predator on the Atari Jaguar. "We watched the movies again and again on VHS tape," says Jason. "We had to cope with the terrible freeze-framing of VHS. We even photographed the TV screen to get stills – not that easy to do with the awful freeze-frame and CRT interlacing. What we discovered was the visual effects in the movies were created in several different ways, and at times even the same effects were created using two or three completely different techniques. We had to choose the ones that would look best in our game and focused on getting those looking great."

James reveals a similar process for the US team. "We spent a few weeks gorging ourselves on all things Alien or Predator," he says. "We would share ideas for the game during the movie marathons where we watched stuff like the extended editions of Aliens on Laserdisc. And we were lucky to have people like Sean Patten, who became one of the game's designers and is the 'face' of the Marine player character in the Marine HUD. He was a die-hard fan who had built replica models of the Colonial armour, weapons and gear which we used for some of the photo materials in the game."

"Toby and Stuart, the artists at Rebellion, had this cool idea to use photographs of models instead of computer-generated artwork for all of the game," explains James. "The results worked surprisingly well. The walls and floor segments were all tiles that they had made with painted model parts, and they used off-the-shelf model kits of the Alien and Predator characters to create a kind of 'stop motion' animation for all of the frames of creatures' movements in the game."

James helped the British art department by thoughtfully smuggling a handy Xeno-model out of the US while he was overseas. "UK Customs wouldn't allow them to receive a model of the Alien Queen that they had ordered by mail, and so on one of my visits over to their offices in Oxford, I went to Mr Big's Toyland in Waltham, Massachusetts, tracked down the model, and smuggled it in my suitcase to get it to them in time!"

"We created all the art in Oxford," adds Chris. "We did this by first building small-scale models of the panels. These were 9cm by 9cm squares of cardboard with bits of paint, straws, plastic gubbins stuck and moulded in, then photographed by Jason in 35mm. We then processed and scanned the photographs in using a flat-bed scanner, and finally touched them up by hand in a paint package, and added any transparent areas. We still have most of the panels in our archive."

Working with a console that was still effectively in the development stage was an unusual process for both teams. Andrew remembers constantly rewriting various graphic routines as the Jaguar's hardware was being finalised, before hitting on the idea of coding new

game elements, then suggesting the hardware features to implement them. "We made numerous design decisions based on what was technically feasible, trying to play to the strengths of what we had working," admits James. "In some instances what may have been a limitation turned into an identifying feature in the game."

"Game over man"

So when we found that the memory limitations weren't going to let us have a movie-like symphonic score, we opted to go the other direction, and create an eerie soundscape from the ambient space station noise. The result added a lot of dramatic tension and

captured the spooky feeling of being alone – until a threatening Predator clicking sound appeared nearby."

As for the role of id's games – *Wolfenstein 3D* and *Doom* – as an influence on *Alien Vs Predator*, Jason and Chris are quick to deny

that they had much of an impact, if any. "We weren't aware of *Doom* at that stage, and only halfway through development did we hear about *Wolfenstein*, so we were using different reference points (step-based dungeon exploration titles) adding realistic textures and vision modes, and adding a dash of acid blood to block your path." James, however, acknowledges a certain level of influence while working on *Alien Vs Predator*, at least from his own team's perspective. "Before starting at Atari, I had spent time playing the first 'episodes' of *Wolfenstein* that were being released on bulletin boards," he admits. "This kind of first-person gameplay definitely influenced me, and over the course of the AVP development cycle, we encouraged all of the team

"WE ENCOURAGED THE TEAM TO PLAY GAMES LIKE WOLFENSTEIN AND DOOM"

METAMORPHOSIS

Trying to squeeze the game into a standard 2MB Jaguar cartridge proved quite a headache for both teams, with Rebellion in particular spending a lot of time compressing textures and data to fit. But, unknown to the UK team, Atari was about to make an unusual u-turn.

"The photorealistic textures looked great but also took up a lot of space and eventually we ran out of room for all of the components of the game on the original cartridge size," explains James. "With some pressure from Fox (to add some additional Alien animation) and some campaigning internally, Sam Tramiel again made the 'right choice' and let us double the cartridge size.

The decision came at the 11th hour, about a month before the game was due to be sent to manufacturing, and we used most of the space for extra audio samples throughout the game. This allowed us to add in more audio effects, which really brought the game together and pushed it to a new level. The extra space also allowed us to include some nice touches like adding Sandra Miller's recorded dialogue, who in addition to being married to Richard Miller, one of the chief Jaguar hardware engineers, added her distinctive British accent for the space station's computer voice."

The pub in this interlude is of course The Star. "It was Brid's trendy pub," Paul assures us. "No sawdust and few fights."

to play games like *Wolfenstein* and *Doom*. We envied the network gameplay, and we always speculated what it would be like to make a head-to-head version of AVP, which wasn't feasible in the time frame we had."

Andrew wanted to add artificial intelligence like 'pack-hunting' behaviour for the Aliens, which would work to lead unwary players into traps – a feature he had christened 'Alien Chess'. In the long run this subtle feature would distinguish the game from rivals like *Doom*, whose monsters would simply become active when the player approached, rather than actively chase or lie strategically in wait when the player entered their virtual environment.

In the spring of 1994, the game reached a critical point in its development. "Rebellion had got the game into a 'first playable' condition, where you could walk around a randomly generated maze," remembers James. "The photorealistic look of the models really worked well, however, there was no structure or gameplay and the project was reaching the end of its original schedule and budget. To his credit, Sam Tramiel, the president at Atari at the time, resisted the urge to cut all the game features and just 'ship it', and followed my plan to push the schedule to a fall release and bring Rebellion programmers Mike Beaton and Andrew Whittaker to California to work on site for the summer."

The end of the line

Andrew took the 'long way round', with a (previously scheduled and unavoidable) business visit to Kuala Lumpur, where he set up a temporary development station at the home of his Malaysian host. With team members split between locations at Rebellion and Atari, and sometimes at various points across the globe, it was inevitable that things didn't always run smoothly. "There were a lot of politics too at that time, and many arguments about credits and so on," reveals Jason.

There were tales of corporate kindness, too. When the game was finally completed, a grateful Sam Tramiel gave Andrew a hefty bonus, along with the keys to his brand new sports car, and told him to take off for a two-month vacation.

Alien Vs Predator garnered generally favourable reviews on its release, including a 98% rating in US publication *GameFan*. *Edge* magazine, however, described the game as "a lumbering, lame and unfocused imitation of *Doom* that only the most masochistic gamers will get anything out of," awarding it

a less-than-stellar four out of ten review score. "Oh yes, everyone else gave it a nine out of ten, but *Edge* didn't!" chuckles Jason. "Everyone is entitled to their opinions, but they also have to face up to criticism of that sort of score from history."

"THERE WERE A LOT OF POLITICS AT THAT TIME, AND MANY ARGUMENTS ABOUT CREDITS"

JASON KINGSLEY

The game was ultimately successful, selling around 300,000 units, and becoming one of the Jaguar's 'killer apps', alongside Jeff Minter's brilliant *Tempest 2000*. "We had a great time working on *Alien Vs Predator*," admits Jason. "It was one of the first titles we worked on as Rebellion. The company has grown from one employee in our basement to over 310 people at multiple locations throughout the UK, and we still love making games."

Perhaps the greatest lasting testament to the Jaguar game is the fact it still ranks highly on lists and polls of all-time scariest videogames (such as a recent fourth placing at *Gametrailers.com*). "I was at a Comic-Con in San Diego one year, when a fan stopped me because I was wearing one of the 'AVP' development 'crew' shirts that I had made up for the team," says James. "They shook my hand saying how much they liked the game and how many nights they stayed up all night playing it, scaring the heck out of them. Hearing it then, makes me think that all the times we worked all night making the game... it was worth it."

40 REASONS WHY WE LOVE ATARI

IT BROUGHT CARTRIDGE-BASED GAMING TO THE MASSES AND WAS INSTRUMENTAL IN ESTABLISHING THE VIDEOGAMES INDUSTRY. WITH THE ATARI BRAND CELEBRATING ITS 40TH ANNIVERSARY THIS YEAR, WE REVEAL 40 THINGS THAT MADE ATARI SYNONYMOUS WITH GAMING

AL ALCORN

Allan Alcorn is an important cog in the Atari Inc wheel, as he was directly involved in many of the company's early successes. He became its first ever design engineer and was directly responsible for the creation of *Pong*, as well as *Space Race* and *Gotcha*. He was also involved in the creation of the Atari 2600 and squeezing *Pong* onto a single chip for its home release.

THE ATARI 2600

One of the most iconic game systems ever made, the VCS/2600 wasn't the first games console, nor was it the first to take cartridges, but it was instrumental in popularising cartridge-based gaming. With the exception of dedicated *Pong* consoles, it was Atari's first proper stab at bringing the arcade experience into people's homes and also helped divide the industry into two markets: domestic and coin-op. Released in October 1977, and originally retailing for \$199, the VCS was packaged with *Combat*, and after a slow start, by 1980 it became the new must-have console, thanks in no small part to its *Space Invaders* port. Before being discontinued in the early Nineties, it received a series of variations, but its most recognisable and beloved is the distinctive original six-switch woodgrain model.

ATARI COMMERCIALS

Today's videogame adverts are incredibly slick productions with feature big budgets, celebrity appearances, renowned directors and recognisable music tracks, but of course Atari Inc was there first. Some of its first commercials featured numerous celebrity appearances, from well-known sports stars to famous actors and comedians. Atari also wasn't averse to throwing money at the games it was constantly working on if it saw that the game in question had a chance of being potentially successful. This is evidenced by its award-winning commercial for Howard Scott Warshaw's *Yars' Revenge*, a brilliant two-minute short that brought together computer graphics and live-action film, and played in movie theatres. Needless to say all publishers now do this.

SCREEN CAMEOS AND PARAPHERNALIA

Atari Inc's ownership by media giant Warner Communications meant plenty of pioneering cross-marketing. Atari's games and branding were used to sell bed sheets, children's costumes, storybooks, records, party decorations and more. Warner also leveraged another of its subsidiaries, DC Comics, for a number of comic book crossovers, including Atari's own series called *Atari Force*. Likewise, Warner's Hollywood connections were able to get Atari and its products in major movies like *Blade Runner*, *E.T.*, and *Airplane!* (pictured), as well as TV shows such as *ALF* and *The A-Team*.

NOLAN BUSHNELL

One of videogames' founding fathers, Nolan Bushnell was the engineer and brilliant entrepreneur who co-founded Atari Inc with Ted Dabney. After working with Nutting Associates to release the Spacewar!-influenced coin-op *Computer Space*, both men left to set up Atari in 1972. Following the success of Pong, Warner Communications purchased Atari Inc in 1976 and the following year helped it get the VCS to market. Following an internal struggle with Warner, Bushnell left Atari in 1978 and launched a number of successful businesses. In 2010 he made a surprise return to the brand when he joined the board of directors at Atari SA (formerly Infogrames Entertainment SA).

THAT CONTROLLER

As the complexity of games has increased, so controllers have had to evolve to keep up. Today's pads can almost be described as hand gyms, giving your extremities a complete workout across pressure-sensitive face buttons, analogue nubs, D-pads and touch pads. Back in their infancy, though, games were far simpler and virtual heroes could navigate their worlds with accessible control schemes. Though simple, the Atari 2600 controller was both functional and clever; that its design was so straightforward meant it was perfect for kids and novice gamers to grasp. Yes, it was far from perfect, and the more common CX-40 models were stiff, but it still got the job done.

"TODAY'S PADS CAN ALMOST BE DESCRIBED AS HAND GYMS"

USE A JOYSTICK

RUDE 2600 GAMES

With the Atari 2600 becoming a staple fixture inside many American homes, numerous companies were keen to try to profit from the console's large install base. At the height of the machine's popularity, this caused massive game saturation in North America and a torrent of shovelware to find its way to game shelves. It also resulted in a series of terrible pornographic 2600 games by adult movie company Mystique. Clearly thinking that sex sells – even ugly digital sex – it released *Bachelor Party*, a *Breakout* clone where the paddle is a naked man and the blocks naked girls; *Beat 'Em & Eat 'Em*, which isn't a scrambled egg making simulator; and the controversial *Custer's Revenge*.

COOL PACKAGING

Hardware and videogame manufacturers spend a lot of money and time to come up with the design of their packaging in a bid to make them stand out on shop shelves, and this practice can be traced back to Atari. It was the first publisher to really use packaging to create a strong brand identity through its bright, colourful VCS boxes. Using clear text, attention-grabbing cover hits and the title of the game printed across the spine, they shared much in common with magazine covers. Atarisoft boxes for other formats were also colour-coded, and this again became a staple – exemplified by the orange, red and yellow flashes used to signify CPC, C64 and Spectrum games respectively in the UK, and the graph paper borders used on the box covers of Mega Drive and Master System games.

ATARI LYNX

We've said it time and time again, but the Atari Lynx, despite being large, expensive and a battery-sucking monster, is a fantastic portable home to a wealth of impressive arcade conversions, and some enjoyable exclusive titles too. Developed with Epyx Games, it was the first portable to feature a colour display and an integrated backlight. Suffering from a lack of third-party support, though, and sharing a release year with the far cheaper and more pocket-friendly Game Boy meant the Lynx sadly bombed and was eventually forsaken by Atari Corporation after an unsuccessful 1990 relaunch with the redesigned Lynx II. This in itself is a real shame as it has a staggering number of amazing arcade ports, ranging from *Roadblasters* to *S.T.U.N. Runner*, which proved just how good the handheld could be when placed in capable hands.

RAY KASSAR

Kassar reigned from 1978 to 1983, first as president and later as CEO, shifting the company away from game development to focus on sales of Atari products. Although Kassar was responsible for Atari's sales growth from \$75 million to \$2.2 billion in three short years, he's now infamous for his resignation over allegations of insider trading and the indirect forming of rival Activision. When David Crane, Larry Kaplan, Bob Whitehead and Alan Miller asked for commission on their games, Kassar said: "You are no more important to that game than the guy on the assembly line who puts it together." The group left to start Activision, the first third-party publisher.

"THE ATARI LYNX IS A FANTASTIC PORTABLE HOME TO A WEALTH OF IMPRESSIVE ARCADE CONVERSIONS AND GREAT EXCLUSIVES"

YOU REALLY NEED A LYNX

PONG

The first game Atari Inc ever released, *Pong* started life as a simple training exercise that Bushnell assigned to the company's first ever design engineer, Allan Alcorn. The brief was to create a game with two paddles, a moving spot and a scoreboard, and, working to this remit, unsurprisingly, Alcorn developed a version of electronic tennis. After a series of tweaks, adding sound effects and realistic return physics, the first prototype of *Pong* was installed in Andy Capp's Tavern in California. Within days of being installed, the prototype began developing technical issues, and closer inspection revealed that the issue stemmed from an overfeeding of quarters. Realising straight away the potential, Atari decided to manufacture and ship the machines itself.

JACK TRAMIEL

Following the collapse of Atari Inc, in 1984 the company was divided into two parts. While Warner Communications retained the arcade division, which was renamed Atari Games, what remained of its computer and console division was purchased by business entrepreneur Jack Tramiel, the Commodore International founder who brought the Commodore PET, VIC-20 and Commodore 64 to market. It was folded into his Tramiel Technology Ltd, which was renamed Atari Corporation. It marked the second incarnation of Atari, though now the brand was split between two owners.

FORMING KEE GAMES

Though initially thought to be a competitor of Atari Inc, Kee Games was actually a subsidiary. Headed by Joe Keenan, Bushnell's next-door neighbour, the company was set up as a way for Atari to circumvent the exclusivity terms laid down by arcade distributors. By Kee releasing a number of Atari game clones, Atari could profit from deals with multiple distributors. When this canny business manoeuvre was discovered in 1974 and Kee started doing its own popular games like *Tank*, Kee Games was folded into Atari and Keenan was promoted to president.

E.T.: THE EXTRA-TERRESTRIAL

Atari is a company as famous for its failures and missteps as its wins and successes. When thinking of a list of commercial videogame super flops, one title always springs to people's minds. Based on the popular Steven Spielberg movie, *E.T.* was a rushed production, reputedly developed in just five weeks. Trying to lure Spielberg away from Universal, Warner Communications' head, Steve Ross, brokered his own deal with the director to secure the licence for a considerable sum of money. The deal, in which one condition was that it would be ready for the festive season, was forced on Atari Inc. Knowing it would have to sell a lot of copies, it signed off on an order for some 5 million cartridges. However, the game went on to sell just over a fifth of that number, and of those that did sell, a large number were promptly returned to Atari with complaints that the game wasn't enjoyable. With Atari left to stomach the loss and embarrassment, its reputation was tarnished and its profits never recovered.

STAR WARS ARCADE GAMES

Being such a dominant force in the videogame arena enabled Atari Inc to secure many movie licences, and by far the most lucrative was *Star Wars*. Atari released two similar vector shooters based on *A New Hope* and *The Empire Strikes Back*, and a horizontal raster shooter based on *Return Of The Jedi*. *Star Wars* was released in 1983 and allowed players to re-enact the Death Star assault from the movie's finale. Widely regarded as one of the best vector games ever, it featured digitised speech and music from the movie, colourful vector graphics and, thanks to that lavish sit-down cab, immersive gameplay.

THE ATARI JAGUAR

Following its abandonment of the Lynx, Atari Corp tried once again to regain a foothold in the home videogame console market. It set about achieving this task with a powerful new console to blow the competition out of the water. Designed by the very same minds behind the never-released Konix Multisystem, and released in November 1993, the Atari Jaguar was the first 64-bit games machine. Despite its impressive technical specs and an ambitious virtual reality headset peripheral, though, the Jaguar was a commercial flop for Atari, ultimately hurt by a lack of decent exclusive software and the looming threat of upcoming hardware from Sega and Sony. Despite its failings, today the Jaguar enjoys a relatively fruitful homebrew scene and has garnered a loyal fan base.

CHUCK E. CHEESE'S

EATING PIZZA AT CHUCK E CHEESE'S

Nolan Bushnell was a huge fan of amusement parks and The Walt Disney Company. In fact, after graduating from university, Bushnell sought employment at Disney but was unsuccessful. To finally scratch that itch, in 1977, while still working at Atari, he decided to set up Chuck E Cheese's Pizza Time Theatre, a pizza restaurant chain fitted with various theme park-style attractions, including arcade and redemption ticket machines, rides, and animatronics shows, all aimed at children as well as cleverly operating as a distribution outlet for Atari games.

When Bushnell left Atari in 1978, he purchased the business from Warner Communications and grew it through the restaurant franchise model. However, the speed at which the videogame industry was evolving put a considerable strain on the business, and in 1983 the company filed for bankruptcy. Its assets were then purchased by rival pizzeria chain Showbiz Pizza Place. The chain still operates today, now under the new name of *Chuck E Cheese's*.

TED DABNEY

Virtually everyone associates Atari with Nolan Bushnell, but that tells only half the story. Atari Inc was actually co-founded by Bushnell and partner Ted Dabney, who had first set up Syzygy Engineering together. While Bushnell became the face and mouthpiece of Atari, Dabney stayed in the shadows and has only recently begun to recount his memories of the fast-changing period.

"DESPITE ITS IMPRESSIVE TECHNICAL SPECS, THE JAGUAR WAS A COMMERCIAL FLOP FOR ATARI"

ATARI'S LAST CONSOLE BOWS OUT

The games

A NEW AUDIO-VISUAL EXPERIENCE FROM ATARI

ATARI VIDEO MUSIC

Thankfully not an embarrassing promotional music video starring the So Solid Atari Crew, but an audio visualisation unit released by Atari in 1975. The brainchild of Bob Brown, inventor of *Home Pong*, *Atari Video Music* could be hooked up to a stereo and television, and by adjusting a single colour and two contour dials, it was possible to create trippy images on your telly to impress your friends when you hosted cocktail parties. Coincidentally, many years down the line Jeff Minter created a similar concept with the *Virtual Light Machine* program for the Jaguar CD, which came integrated into its hardware.

DEMAKES

Like most retro consoles, the 2600 enjoys a healthy homebrew scene, made up of passionate programmers looking to continually eke more from the console's clever custom computer chip. More recently, though, the machine has become a popular platform for demakes, the art of re-creating current games on older platforms. You can play 2600 versions of *Portal* (*Super 3D Portal 6*), *Mega Man* and even *Halo* (*Halo 2600*) on the machine.

"ONE OF THE BLEAKEST COIN-OPS OF THE AGE"

THE IMPACT OF MISSILE COMMAND

MISSILE COMMAND

A Cold War nightmare led Dave Theurer to create *Missile Command* – a frantic and challenging trackball-controlled shooter that tasked players with protecting cities from ballistic missiles. One of the bleakest coin-ops of the age, the following year gamers were flocking to play the more lighthearted likes of *Pac-Man*, *Donkey Kong* and *Frogger*. *Missile Command* has become synonymous with the Atari brand and had its popularity raised with an impressive conversions for the 2600.

ATARI 5200

As a riposte to the booming personal computer market, in 1979 Atari released the Atari 8-bit family of personal computers, kicking off with the Atari 400 and 800 models. However, by the early Eighties a slew of new games consoles had entered the market, and Atari quickly realised that if it was to protect its console market share it would have to release a successor to the 2600. In 1982, the company released the Atari 5200, which utilised technology that was heavily cribbed from the 400 and 800. Despite Atari's strong status in the market, the 5200 wasn't as successful as its predecessor. Many cite as the main causes a shortage of new software and its lack of backwards compatibility with Atari 2600 titles.

JAY MINER

Before the talented graphic chip designer became the founding father of the Amiga Corporation, Jay Miner was responsible for leading the design team of the television interface adaptor (TIA), the clever computer chip inside the VCS that was responsible for everything from its graphics, animation and colours to sound and controller registers. At the time when the VCS was in development, RAM was expensive and the TIA's clever design, which forced programmers to write their own OS each time, offering amazing flexibility and allowing Atari to keep the cost of the machine affordable for consumers. Miner later developed the concept with display lists for Atari's 8-bit computers, and later still with the Amiga.

PITFALL HARRY

Though he wasn't a creation of Atari, David Crane's Pitfall Harry was the closest thing the Atari 2600 ever had to a mascot. Selling over 4 million copies, *Pitfall!* is the bestselling third-party 2600 game, and spawned a popular platforming franchise that this year celebrates its 30th anniversary.

"PITFALL! IS THE BESTSELLING THIRD-PARTY 2600 GAME, AND SPAWNED A POPULAR PLATFORMING FRANCHISE"

DAVID CRANE DOES GOOD

YARS' REVENGE

Developed by Howard Scott Warshaw, and starting out as a port of *Star Castle*, *Yars' Revenge* went on to become the 2600's bestselling original title after some inspired design. Despite being played over a single screen, it has deep gameplay and a detailed back story, which got explained in a comic book that came with the game. Telling the tale of a race of insect humanoids who are trying to save their home from malevolent aliens, your mission is to destroy an enemy mega-weapon. It's a defining game for Atari's console.

THE 9-PIN JOYSTICK PORT

It might seem throwaway, but the 9-pin plug that Atari Inc helped popularise through the 2600 made a huge impact on the gaming industry. Virtually everything, from the Mega Drive to the 3DO, supported it, meaning you could effectively plug a 2600 joystick into your console and start playing. It would be many years later before consoles and PCs started using the now-standard USB format.

VECTOR GRAPHICS

Atari didn't invent the use of vector graphics in arcade games – that honour goes to Cinematronics – but the slew of successful vector games it released throughout the Eighties certainly resonated most with gamers. With soaring hits like *Asteroids*, *Tempest*, *Battlezone* and *Star Wars*, Atari's vector output forms a large part of its most iconic and popular arcade games, and not only helped to popularise the graphic style but also cemented Atari's prominence in arcades.

The games

"MANY OF ITS GAMES INFLUENCED A LOT OF MINTER'S MEMORABLE CLASSICS"

ATARI INC'S INFLUENCE WAS EVERYWHERE...

THE ATARI 8-BIT FAMILY

The early Atari 8-bits originated from a chip that was supposed to power Atari's follow-up to the 2600. Ray Kassar had other ideas, however, wanting to instead use the chip in a computer to combat Apple's range of micros. The original systems were released in 1979 and were called the Atari 400 and 800. These were later replaced by the 1200 and numerous other XLs in 1982, and later the XE range, which began appearing from 1985. Numerous classics made their debut on Atari's family of micros, including *Archon*, *The Light And The Dark*, *Rescue On Fractalus!*, *Boulder Dash*, *Koronis Rift*, *Bruce Lee*, *Ballblazer* and *Spy vs Spy*.

THE ATARI LOGO

The Atari name is said to have derived from a 'check mate' term used in the ancient Chinese draughts-style game, go. The term means 'to hit'. Nolan Bushnell was a massive fan of Go, and would play it regularly, so this little nugget of information makes perfect sense.

JEFF MINTER

Jeff Minter is an interesting offshoot of Atari's reach, because he wasn't involved with either company until he worked for Atari Corporation. And yet Atari Inc is still important here, as many of its games influenced a lot of Minter's most memorable classics. *Gridrunner* was inspired by the excellent *Centipede*, while *The Empire Strike Back* led to the trippy *Attack Of The Mutant Camels*. It was *Tempest*, though, which would impact greatly on Minter's life, as aside from his own variations – most notably *Space Giraffe* – he created the truly sublime *Tempest 2000*, which was easily the best game to grace Atari's ill-fated Jaguar.

EASTER EGGS

Atari Inc was infamous for not crediting its programmers for their work. However, disgruntled coders often got around this by incorporating hidden messages in their games. The first well-known example of this happening in a home videogame was in the VCS game *Adventure*, the famous Easter egg seeing its programmer, Warren Robinett, credited for making the game. According to Robinett, it was Atari that dubbed these secrets 'Easter eggs', with the term relating to the fact that players would hunt them out. There's also a clever one when you approach the Death Star in *Star Wars*.

ASTEROIDS

When Lyle Rains, Dominic Walsh and Ed Logg came up with the idea for their vector-based shooter, little did they know that it would go on to become Atari's most successful arcade game. Hailed as one of the most important games of the famed 'golden age' of the arcades, it sold over 700,000 units and influenced numerous other games of the period.

FORMING TENGEN

When Warner Communications retained the arcade division of Atari Inc, resurrecting it as Atari Games, it was bound by an agreement with Jack Tramiel that it would not encroach on the domestic videogame market using the Atari name. To get around this and try to profit from publishing Atari arcade games on home consoles and computers, it decided to set up a new label. That label was known as Tengen, borrowing another term from go. Tengen had very close ties with Namco through Warner's selling of Atari Games to Namco in 1985, and Tengen was taken to court by Nintendo twice, once for releasing unlicensed games for the NES and on another occasion over a copyright breach in *Tetris*. The label was disbanded in 1994 by Time, following Warner Communications' merger with magazine publisher Time Inc.

NEARLY GETTING TO RELEASE THE NES

This is a particularly interesting nugget of information, as it could have single-handedly defined Atari's fortunes after the videogame crash. Atari had already released several Nintendo games on its Atari 2600, so Nintendo offered a one-sided OEM deal, which saw Nintendo as the sole supplier of all parts and internals and Atari being allowed to simply design the case and put its name on it. The only proviso? It had to be ready by Christmas '83. Unfortunately for Atari, the loss of Ray Kassar and the lateness of his replacement – Jim Morgan took a two-month vacation before starting in September – meant that Atari had no time to make the Christmas season. Nintendo head Hiroshi Yamauchi decided to go it alone, and the rest is history. We can only imagine what might have happened to Atari's fortunes if it had signed that contract. We love them for trying though.

ED LOGG

If Ed Logg had never decided to make games, the arcades of the world would have been much sadder places, as he created some of Atari's best games. There would have been no *Asteroids*, *Gauntlet*, *Centipede*, *Road Runner*, *Xybots*, or many other games. The talented programmer is still around, having recently joined Innovative Leisure to make iOS games with many other Atari alumni.

ATARI COMPUTER CAMP

Forming part of Atari's assault on the education market, Atari Computer Camps were where parents could cart off their kids for a few weeks each summer. The camps took kids from between 10 and 16 years old, and ran for two, four or eight-week sessions. In addition to the traditional camp activities, the schedule included a series of computer workshops, as well as lectures.

KILLER APPS

Atari Inc created one of the first examples of a 'killer app' when it purchased the *Space Invaders* licence and released a home version for the 2600. Its success paved the way for a steady stream of arcade conversions on the console – many from Atari's own arcade catalogue but just as many licensed from other developers too. Probably the most infamous was the 2600 port of *Pac-Man*. Though it became the bestselling game on the 2600, it is regarded as a disappointing version and was critically blasted.

TIE-IN COMICS

More clever marketing saw Atari commission a series of comic books to package with its VCS games. Several were themed on videogames, including *Centipede*, *Swordquest* and *Yars' Revenge*, and there was also a four-part comic book series titled *Atari Force*, which starred a band of intergalactic hero types. Packaged with the sci-fi games *Defender*, *Star Raiders*, *Berzerk*, *Galaxian* and *Phoenix*, *Atari Force* was later spun into a full comic book series. A total of ten comics were created for VCS games and all were published by DC Comics, a subsidiary of Warner.

ATARI ST

The ST was one of the earliest 16-bit computers and the first to feature integrated MIDI support. Created by Shiraz Shivji, it was released by Atari in 1985 and became highly lauded for its excellent music software, which would be used by a number of musicians, including White Town, The Berzerker, Luke Vibert and Mike Oldfield. Its head start on the Amiga also meant that it hosted a number of excellent titles that weren't available on its rival, like *F-15 Strike Eagle*, *Get Dexter* and *Oids*.

ITS RISK-TAKING

Despite what you might think, prior to the crash the domestic industry hadn't been in decline. In fact, it had never been in better health. The early Eighties gave rise to more consoles, more peripherals and more games than ever. To stay at the top, Atari spent big on the most attractive licences and confident over-ordering of stock. Rushing product out the door to meet profitable holiday seasons resulted in cancelled orders from retailers and worthless assets piling up in warehouses. Saturation, overproduction, confused consumers and poor product soon took their toll on the company, and in a single year, Atari's profits went from \$2 billion in 1982 to a loss of \$539 million in 1983.

Exclusive offer for new

Try
3 issues
for just
£5*

* This offer entitles new UK Direct Debit subscribers to receive their first three issues for £5. After these issues, subscribers will then pay £22.50 every six issues. Subscribers can cancel this subscription at any time. New subscriptions will start from the next available issue. Offer code ZGGATARI must be quoted to receive this special subscription price. Direct Debit guarantee available on request. This offer will expire 13th December 2013.

** This is a US subscription offer. The USA issue rate is based on an annual subscription price of £65 for 13 issues, which is equivalent to \$105 at the time of writing compared with the newsstand price of \$9.99 for 13 issues, being \$129.87. Your subscription will start from the next available issue. This offer expires 13th December 2013.

About
the
mag

**The only UK
magazine dedicated
to retro games**

Unmissable Interviews

Every issue is full of one-on-one exclusive interviews with the original developers

In-depth articles

Exhaustive guides dedicated to all of the greatest classic gaming franchises

Nostalgia Overload

Get those nostalgia glands going thanks to excellent articles that cover the good old days

subscribers to...
